## **INTRODUCTION**

LOOT is a utility that helps users avoid serious conflicts between their mods by setting their plugins in an optimal load order. It also provides tens of thousands of plugin-specific messages, including usage notes, requirements, incompatibilities, bug warnings and installation mistake notifications, and thousands of Bash Tag suggestions.

This metadata that LOOT supplies is stored in its masterlist, which is maintained by the LOOT team using information provided by mod authors and users. Users can also add to and modify the metadata used by LOOT through the use of userlist files. libloot provides all of LOOT's non-UI-related functionality, and can be used by third-party developers to access this metadata for use in their own programs.

## MISCELLANEOUS DETAILS

### 2.1 String Encoding

- All output strings are encoded in UTF-8.
- Metadata files are written encoded in UTF-8.
- Input strings are expected to be encoded in UTF-8.
- Metadata files read are expected to be encoded in UTF-8.
- File paths are case-sensitive if and only if the underlying file system is case-sensitive.

### 2.2 Language Codes

All language strings in the API are codes of the form `ll` or `ll_CC`, where `ll` is an ISO 639-1 language code and `CC` is an ISO 3166 country code. For example, the default language for metadata message content is English, identified by the code `en`, and Brazilian Portuguese is `pt_BR`.

### 2.3 Errors

All errors encountered are thrown as exceptions that inherit from `std::exception`.

### 2.4 Metadata Files

LOOT stores plugin metadata in YAML files. It distinguishes between three types of metadata file:

- *masterlist* files: each game has a single masterlist, which is a public, curated metadata store
- *masterlist prelude* files: there is a single masterlist prelude, which is a public store of common metadata templates that can be shared across all masterlists
- *userlist* files: each game has a userlist, which is a private user-specific metadata store containing metadata added by the LOOT user.

All three files use the same syntax, but the masterlist prelude file is used to replace part of a masterlist file before it is parsed, and metadata in the userlist extends or replaces metadata sourced from the masterlist.

LOOT's plugin metadata can be conditional, eg. a plugin may require a patch only if another plugin is also present. The API's `loot::DatabaseInterface::LoadLists()` method parses metadata files into memory, but does not

evaluate these conditions, so the loaded metadata may contain metadata that is invalid for the installed game that the `loot::DatabaseInterface` object being operated on was created for.

## 2.5 Caching

All unevaluated metadata is cached between calls to `loot::DatabaseInterface::LoadLists()`.

The results of evaluating metadata conditions are cached between calls to `loot::GameInterface::LoadPlugins()`, `loot::GameInterface::SortPlugins()` and `loot::DatabaseInterface::GetGeneralMessages()`.

Plugin content is cached between calls to `loot::GameInterface::LoadPlugins()` and `loot::GameInterface::SortPlugins()`.

Load order is cached between calls to `loot::GameInterface::LoadCurrentLoadOrderState()`.

## 2.6 Performance

The following may involve filesystem access and reading/parsing or writing of data from the filesystem:

- Any function that takes a `std::filesystem::path`
- `loot::GameInterface::IsValidPlugin()`
- `loot::GameInterface::LoadPlugins()`
- `loot::GameInterface::LoadCurrentLoadOrderState()`
- `loot::GameInterface::SetLoadOrder()`

Evaluating conditions may also involve filesystem read access.

`loot::GameInterface::SortPlugins()` is expensive, as it involves loading all the content of all the plugins, apart from the game's main master file, which is skipped as an optimisation (it doesn't depend on anything else and is much bigger than any other plugin, so is unnecessary and slow to load).

`loot::DatabaseInterface::GetGroupsPath()` involves building a graph of all defined groups and then using it to search for the shortest path between the two given groups, which may be relatively slow given a sufficiently large and/or complex set of group definitions.

All other API functions should be relatively fast.

## LOOT'S SORTING ALGORITHM

LOOT's sorting algorithm consists of the following stages:

- *Load plugin data*
- *Create plugin graph vertices*
- *Create plugin graph edges*
  - *Hardcoded edges*
  - *Group edges*
  - *Overlap edges*
  - *Tie-break edges*
    - \* *Pinning vertex positions*
- *Topologically sort the plugin graphs*
- *Combine the two load orders*

### 3.1 Load plugin data

In this first stage, the plugins to be sorted are parsed and their record IDs (which are FormIDs for all games apart from Morrowind) are stored. When parsing plugins, all subrecords are skipped over for efficiency, apart from the subrecords of the TES4 header record.

Loading plugin data also involves loading any metadata that the plugin may have in the masterlist and userlist.

### 3.2 Create plugin graph vertices

Once the plugins have been loaded, they are sorted into their current load order:

- If both plugins have positions in the current load order, the function preserves their existing relative order.
- If one plugin has a position and the other does not, the plugin with a position goes before the plugin without a position.
- If neither plugin has a load order position, a case-insensitive lexicographical comparison of their filenames without file extensions is used to decide their order. If they are equal, a case-insensitive lexicographical comparison of their file extensions is used.

After that, two graphs are created, and the plugins are added to them as vertices in their sorted order. Plugins that have their master flag set go in one graph, and plugins that do not have the flag set go in the other.

Two graphs are used because master-flagged plugins must always load before non-master-flagged plugins, and it's much more efficient to sort them separately and then combine their load orders than to enforce those relationships within a single graph.

A consequence of using two separate graphs is that any plugin data or metadata that involves a pair of plugins with and without their master flag set will be silently ignored. For example: if plugin A is master-flagged and plugin B is not, and plugin A has metadata saying it must load after plugin B, then that metadata will be ignored because the two plugins are sorted independently, as if the other plugin is not installed.

## 3.3 Create plugin graph edges

The steps described in this section are run on both graphs independently.

In this section, the terms *vertex* and *plugin* are used interchangeably, and the iteration order 'for each plugin' is the order in which the vertices were added to the graph.

For each plugin:

1. If the plugin is a master file, add edges going to all non-master files. If the plugin is a non-master file, add edges coming from all master files. This shouldn't result in any edges being added, since masters and non-masters are sorted in separate graphs, but is done for completeness.
2. Add edges coming from all the plugin's masters. Missing masters have no edges added.
3. Add edges coming from all the plugin's requirements. Missing requirements have no edges added.
4. Add edges coming from all the plugin's load after files that are installed plugins.

### 3.3.1 Hardcoded edges

Some games hardcode certain plugins to load in certain positions, and this section adds edges in the correct order between those plugins, and between those plugins and the rest of the plugins in the graph.

### 3.3.2 Group edges

For each plugin, the plugins that are members of groups that the current plugin's group loads after are iterated over and individually checked to see if adding an edge from the other group's plugin to the current plugin would cause a cycle. If not, the edge is queued for addition. If it would cause a cycle and one of the plugins is in the default group and the other group's plugin is master-flagged or the current plugin is not master flagged, then the plugin in the default group is recorded as one to skip adding edges to or from when the prospective edge involves any of the groups in the path from the other plugin to the current plugin.

Once all the plugins have been iterated over, all the queued edges are added, skipping those edges identified in the earlier loop.

At this point the plugin graph is checked for cycles, and an error is thrown if any are encountered, so that metadata (or indeed plugin data) that cause them can be corrected.

### 3.3.3 Overlap edges

Plugin overlap edges are then added. Two plugins overlap if they contain the same record, i.e. if they both edit the same record or if one edits a record the other plugin adds. Plugins also overlap if they both load one or more BSAs (BA2s for Fallout 4) and the BSAs loaded by one plugin contain data for a file path that is also included in the BSAs loaded by the other plugin.

For each plugin, skip it if it overrides no records, otherwise iterate over all other plugins.

- If the plugin and other plugin override the same number of records and the same number of assets, or do not overlap, skip the other plugin.
- Otherwise, add an edge from the plugin which overrides more records to the plugin that overrides fewer records, unless that edge would cause a cycle. If the plugins don't have overlapping records or override the same number of records, the edge is added from the plugin that loads more assets via its BSAs to the plugin that loads fewer assets.

For Morrowind, identifying which records override others requires all of a plugin's masters to be installed, so if a plugin has missing masters, its total record count is used in place of its override record count. Morrowind plugins also can't load BSAs, so they can't have overlapping assets.

### 3.3.4 Tie-break edges

Finally, tie-break edges are added to ensure that sorting is consistent. The graph's vertices are iterated over in their insertion order (i.e. the current load order). Each loop looks at the current vertex and the next one following it (e.g. the first iteration is for vertices 0 and 1, the second is for 1 and 2, etc.).

For each (**current**, **next**) pair of vertices, try to find a path from **next** to **current**.

If sorting makes no changes, then there won't be any paths found and it'll therefore be possible to add an edge from **current** to **next** without causing a cycle, producing the old load order.

If no path is found then that means the old load order can be used for those two plugins. If the **current** vertex has not already been processed (which will be the case unless it appeared in a path found earlier and had its position pinned, see below), append it to a list representing the new load order and record the vertex as having been processed.

If no path is found but the **current** vertex has been processed and is not the last vertex in the new load order list, pin the position of the **next** vertex (see below).

If a path is found then that means the old load order for those two plugins (which is **current** before **next**) can't be used. If **current** is the first vertex in the iteration order, then **next** is simply treated as the start of the new load order. If **current** is not the first vertex, iterate over the vertices in the path found, going from **next** to **current**, and pin each vertex's position.

### Pinning vertex positions

A vertex's position needs to be pinned when it must go somewhere before the last plugin in the new load order list, because although it has a fixed position relative to that last plugin, it doesn't necessarily have a fixed position relative to the plugins that come before the last plugin. I.e. it needs to load earlier, but how much earlier?

To pin a vertex's position, iterate over the new load order list in reverse order, going from the last vertex towards the first, and stop at the first load order vertex for which there is no path going from the unpinned vertex to the load order vertex. This is equivalent to finding the last plugin that the unpinned vertex's plugin can load after (which is not necessarily the same as the last plugin it *must* load after).

If such a load order vertex is found, add an edge going from it to the unpinned vertex. If the found vertex is not the last vertex in the load order list, also add an edge going from the unpinned vertex to the vertex after the found vertex. Then record the unpinned vertex's new position in the new load order list: the vertex is now pinned.

## 3.4 Topologically sort the plugin graphs

This is done for both graphs independently.

Note that edges for explicit interdependencies are the only edges allowed to create cycles. However, the graph is again checked for cycles to guard against potential logic bugs, and if a cycle is encountered an error is thrown.

Once the graph is confirmed to be cycle-free, a topological sort is performed on the graph, outputting a list of plugins in their newly-sorted load order.

## 3.5 Combine the two load orders

Finally, the sorted load order for non-master-flagged plugins is appended to the sorted load order for master-flagged plugins to give the complete sorted load order.

## API REFERENCE

### Contents

- *API Reference*
  - *Constants*
  - *Enumerations*
  - *Public-Field Data Structures*
  - *Functions*
  - *Interfaces*
  - *Classes*
  - *Exceptions*
  - *Error Categories*

## 4.1 Constants

`constexpr unsigned int loot : LIBLOOT_VERSION_MAJOR = 0`  
libloot's major version number.

`constexpr unsigned int loot : LIBLOOT_VERSION_MINOR = 19`  
libloot's minor version number.

`constexpr unsigned int loot : LIBLOOT_VERSION_PATCH = 0`  
libloot's patch version number.

## 4.2 Enumerations

enum `loot::EdgeType`

An enum representing the different possible types of interactions between plugins or groups.

*Values:*

enumerator `hardcoded`

enumerator `masterFlag`

enumerator `master`

enumerator `masterlistRequirement`

enumerator `userRequirement`

enumerator `masterlistLoadAfter`

enumerator `userLoadAfter`

enumerator `masterlistGroup`

enumerator `userGroup`

enumerator `recordOverlap`

enumerator `assetOverlap`

enumerator `tieBreak`

enum `loot::GameType`

Codes used to create database handles for specific games.

*Values:*

enumerator `tes4`

The Elder Scrolls IV: Oblivion

enumerator `tes5`

The Elder Scrolls V: Skyrim

enumerator `fo3`

Fallout 3

enumerator `fonv`

Fallout: New Vegas

enumerator `fo4`

Fallout 4

enumerator `tes5se`

The Elder Scrolls V: Skyrim Special Edition

enumerator `fo4vr`

Fallout 4 VR

enumerator **tes5vr**  
Skyrim VR

enumerator **tes3**  
The Elder Scrolls III: Morrowind

enum `loot::LogLevel`  
Codes used to specify different levels of API logging.

*Values:*

enumerator **trace**

enumerator **debug**

enumerator **info**

enumerator **warning**

enumerator **error**

enumerator **fatal**

enum `loot::MessageType`  
Codes used to indicate the type of a message.

*Values:*

enumerator **say**  
A notification message that is of no significant severity.

enumerator **warn**  
A warning message, used to indicate that an issue may be present that the user may wish to act on.

enumerator **error**  
An error message, used to indicate that an issue that requires user action is present.

## 4.3 Public-Field Data Structures

struct `loot::SimpleMessage`  
A structure that holds the type of a message and the message string itself.

### Public Members

*MessageType* **type** = { *MessageType::say* }  
The type of the message.

`std::string` **language**  
The language the message string is written in.

`std::string` **text**  
The message string, which may be formatted using CommonMark.

std::string **condition**

The message's condition string.

## 4.4 Functions

void loot::SetLoggingCallback(std::function<void(*LogLevel*, const char\*)> callback)

Set the callback function that is called when logging.

If this function is not called, the default behaviour is to print messages to the console.

**Parameters** **callback** – The function called when logging. The first parameter is the level of the message being logged, and the second is the message.

bool loot::IsCompatible(const unsigned int major, const unsigned int minor, const unsigned int patch)

Checks for API compatibility.

Checks whether the loaded API is compatible with the given version of the API, abstracting API stability policy away from clients. The version numbering used is major.minor.patch.

**Parameters**

- **major** – The major version number to check.
- **minor** – The minor version number to check.
- **patch** – The patch version number to check.

**Returns** True if the API versions are compatible, false otherwise.

std::unique\_ptr<*GameInterface*> loot::CreateGameHandle(const *GameType* game, const std::filesystem::path &game\_path, const std::filesystem::path &game\_local\_path = "")

Initialise a new game handle.

Creates a handle for a game, which is then used by all game-specific functions.

**Parameters**

- **game** – A game code for which to create the handle.
- **game\_path** – The relative or absolute path to the directory containing the game's executable.
- **game\_local\_path** – The relative or absolute path to the game's folder in %LOCALAPPDATA% or an empty path. If an empty path, the API will attempt to look up the path that %LOCALAPPDATA% corresponds to. This parameter is provided so that systems lacking that environmental variable (eg. Linux) can still use the API.

**Returns** The new game handle.

std::string loot::GetLiblootVersion()

Get the library version.

**Returns** A string of the form “major.minor.patch”.

std::string loot::GetLiblootRevision()

Get the source control revision that libloot was built from.

**Returns** A string containing the revision ID.

std::optional<*MessageContent*> loot::SelectMessageContent(const std::vector<*MessageContent*> content, const std::string &language)

Choose a *MessageContent* object from a vector given a language.

**Parameters**

- **content** – The *MessageContent* objects to choose between.
- **language** – The locale or language code for the preferred language to select. Locale codes are of the form [language code]\_[country code].

**Returns** A *MessageContent* object.

- If the vector only contains a single element, that element is returned.
- If content with a language that exactly matches the given locale or language code is present, that content is returned.
- If a locale code is given and there is no exact match but content for that locale's language is present, that content is returned.
- If a language code is given and there is no exact match but content for a locale in that language is present, that content is returned.
- If no locale or language code matches are found and content in the default language is present, that content is returned.
- Otherwise, an empty optional is returned.

`std::optional<SimpleMessage> loot::ToSimpleMessage(const Message &message, const std::string &language)`  
 Get a given *Message* as a *SimpleMessage* given a language.

**Parameters**

- **message** – The message to convert.
- **language** – The preferred language for the message content.

**Returns** A *SimpleMessage* object for the preferred language, or for English if message text is not available for the given language.

`std::vector<SimpleMessage> loot::ToSimpleMessages(const std::vector<Message> &messages, const std::string &language)`

Get the given messages as simple messages given a language.

**Parameters**

- **messages** – The messages to convert.
- **language** – The preferred language for the message content.

**Returns** A vector of *SimpleMessage* objects for the preferred language, or for English if message text is not available for the given language. The order of the input *Message* objects is preserved, though any messages without the preferred language or English content will be omitted.

## 4.5 Interfaces

`class loot::DatabaseInterface`

The interface provided by API's database handle.

## Data Reading & Writing

virtual void **LoadLists**(const std::filesystem::path &masterlist\_path, const std::filesystem::path &userlist\_path = "", const std::filesystem::path &masterlist\_prelude\_path = "") = 0

Loads the masterlist, userlist and masterlist prelude from the paths specified.

Can be called multiple times, each time replacing the previously-loaded data.

### Parameters

- **masterlist\_path** – The relative or absolute path to the masterlist file that should be loaded.
- **userlist\_path** – The relative or absolute path to the userlist file that should be loaded, or an empty path. If an empty path, no userlist will be loaded.
- **masterlist\_prelude\_path** – The relative or absolute path to the masterlist prelude file that should be loaded. If an empty path, no masterlist prelude will be loaded.

virtual void **WriteUserMetadata**(const std::filesystem::path &outputFile, const bool overwrite) const = 0

Writes a metadata file containing all loaded user-added metadata.

### Parameters

- **outputFile** – The path to which the file shall be written.
- **overwrite** – If false and outputFile already exists, no data will be written. Otherwise, data will be written.

virtual void **WriteMinimalList**(const std::filesystem::path &outputFile, const bool overwrite) const = 0

Writes a minimal metadata file that only contains plugins with Bash *Tag* suggestions and/or dirty info, plus the suggestions and info themselves.

### Parameters

- **outputFile** – The path to which the file shall be written.
- **overwrite** – If false and outputFile already exists, no data will be written. Otherwise, data will be written.

## Non-plugin Data Access

virtual std::vector<std::string> **GetKnownBashTags**() const = 0

Gets the Bash Tags that are listed in the loaded metadata lists.

Bash *Tag* suggestions can include plugins not in this list.

**Returns** A set of Bash *Tag* names.

virtual std::vector<*Message*> **GetGeneralMessages**(bool evaluateConditions = false) const = 0

Get all general messages listen in the loaded metadata lists.

**Parameters** **evaluateConditions** – If true, any metadata conditions are evaluated before the metadata is returned, otherwise unevaluated metadata is returned. Evaluating general message conditions also clears the condition cache before evaluating conditions.

**Returns** A vector of messages supplied in the metadata lists but not attached to any particular plugin.

virtual std::vector<*Group*> **GetGroups**(bool includeUserMetadata = true) const = 0

Gets the groups that are defined in the loaded metadata lists.

**Parameters** **includeUserMetadata** – If true, any group metadata present in the userlist is included in the returned metadata, otherwise the metadata returned only includes metadata from the masterlist.

**Returns** An vector of *Group* objects. Each *Group*’s name is unique, if a group has masterlist and user metadata the two are merged into a single group object.

virtual std::vector<*Group*> **GetUserGroups**() const = 0

Gets the groups that are defined or extended in the loaded userlist.

**Returns** An unordered set of *Group* objects.

virtual void **SetUserGroups**(const std::vector<*Group*> &groups) = 0

Sets the group definitions to store in the userlist, overwriting any existing definitions there.

**Parameters** **groups** – The unordered set of *Group* objects to set.

virtual std::vector<*Vertex*> **GetGroupsPath**(const std::string &fromGroupName, const std::string &toGroupName) const = 0

Get the “shortest” path between the two given groups according to their load after metadata.

The “shortest” path is defined as the path that maximises the amount of user metadata involved while minimising the amount of masterlist metadata involved. It’s not the path involving the fewest groups.

**Parameters**

- **fromGroupName** – The name of the source group, that loads earlier.
- **toGroupName** – The name of the destination group, that loads later.

**Returns** A vector of *Vertex* elements representing the path from the source group to the destination group, or an empty vector if no path exists.

## Plugin Data Access

virtual std::optional<*PluginMetadata*> **GetPluginMetadata**(const std::string &plugin, bool includeUserMetadata = true, bool evaluateConditions = false) const = 0

Get all a plugin’s loaded metadata.

**Parameters**

- **plugin** – The filename of the plugin to look up metadata for.
- **includeUserMetadata** – If true, any user metadata the plugin has is included in the returned metadata, otherwise the metadata returned only includes metadata from the masterlist.
- **evaluateConditions** – If true, any metadata conditions are evaluated before the metadata is returned, otherwise unevaluated metadata is returned. Evaluating plugin metadata conditions does not clear the condition cache.

**Returns** If the plugin has metadata, an optional containing that metadata, otherwise an optional containing no value.

virtual std::optional<*PluginMetadata*> **GetPluginUserMetadata**(const std::string &plugin, bool evaluateConditions = false) const = 0

Get a plugin’s metadata loaded from the given userlist.

**Parameters**

- **plugin** – The filename of the plugin to look up user-added metadata for.

- **evaluateConditions** – If true, any metadata conditions are evaluated before the metadata is returned, otherwise unevaluated metadata is returned. Evaluating plugin metadata conditions does not clear the condition cache.

**Returns** If the plugin has user-added metadata, an optional containing that metadata, otherwise an optional containing no value.

virtual void **SetPluginUserMetadata**(const *PluginMetadata* &pluginMetadata) = 0

Sets a plugin's user metadata, overwriting any existing user metadata.

**Parameters** **pluginMetadata** – The user metadata you want to set, with plugin.Name() being the filename of the plugin the metadata is for.

virtual void **DiscardPluginUserMetadata**(const std::string &plugin) = 0

Discards all loaded user metadata for the plugin with the given filename.

**Parameters** **plugin** – The filename of the plugin for which all user-added metadata should be deleted.

virtual void **DiscardAllUserMetadata**() = 0

Discards all loaded user metadata for all plugins, and any user-added general messages and known bash tags.

class **loot::GameInterface**

The interface provided for accessing game-specific functionality.

## Metadata Access

virtual *DatabaseInterface* &**GetDatabase**() = 0

Get the database interface used for accessing metadata-related functionality.

**Returns** A reference to the game's *DatabaseInterface*. The reference remains valid for the lifetime of the *GameInterface* instance.

## Plugin Data Access

virtual bool **IsValidPlugin**(const std::string &plugin) const = 0

Check if a file is a valid plugin.

The validity check is not exhaustive: it checks that the file extension is `.esm` or `.esp` (after trimming any `.ghost` extension), and that the TES4 header can be parsed.

**Parameters** **plugin** – The filename of the file to check.

**Returns** True if the file is a valid plugin, false otherwise.

virtual void **LoadPlugins**(const std::vector<std::string> &plugins, bool loadHeadersOnly) = 0

Parses plugins and loads their data.

Any previously-loaded plugin data is discarded when this function is called.

**Parameters**

- **plugins** – The filenames of the plugins to load.
- **loadHeadersOnly** – If true, only the plugins' TES4 headers are loaded. If false, all records in the plugins are parsed, apart from the main master file if it has been identified by a previous call to *IdentifyMainMasterFile*() .

virtual const *PluginInterface* \***GetPlugin**(const std::string &pluginName) const = 0

Get data for a loaded plugin.

**Parameters** *pluginName* – The filename of the plugin to get data for.

**Returns** A shared pointer to a const *PluginInterface* implementation. The pointer is null if the given plugin has not been loaded.

virtual std::vector<const *PluginInterface*\*> **GetLoadedPlugins**() const = 0

Get a set of const references to all loaded plugins' *PluginInterface* objects.

**Returns** A set of const *PluginInterface* references. The references remain valid until the *LoadPlugins()* or *SortPlugins()* functions are next called or this *GameInterface* is destroyed.

## Sorting

virtual void **IdentifyMainMasterFile**(const std::string &masterFile) = 0

Identify the game's main master file.

When sorting, LOOT always only loads the headers of the game's main master file as a performance optimisation.

virtual std::vector<std::string> **SortPlugins**(const std::vector<std::string> &plugins) = 0

Calculates a new load order for the game's installed plugins (including inactive plugins) and outputs the sorted order.

Pulls metadata from the masterlist and userlist if they are loaded, and reads the contents of each plugin. No changes are applied to the load order used by the game. This function does not load or evaluate the masterlist or userlist.

**Parameters** *plugins* – A vector of filenames of the plugins to sort, in their current load order.

**Returns** A vector of the given plugin filenames in their sorted load order.

## Load Order Interaction

virtual void **LoadCurrentLoadOrderState**() = 0

Load the current load order state, discarding any previously held state.

This function should be called whenever the load order or active state of plugins “on disk” changes, so that the cached state is updated to reflect the changes.

virtual bool **IsLoadOrderAmbiguous**() const = 0

Check if the load order is ambiguous.

This checks that all plugins in the current load order state have a well-defined position in the “on disk” state, and that all data sources are consistent. If the load order is ambiguous, different applications may read different load orders from the same source data.

**Returns** True if the load order is ambiguous, false otherwise.

virtual std::filesystem::path **GetActivePluginsFilePath**() const = 0

Gets the path to the file that holds the list of active plugins.

The active plugins file path is often within the game's local path, but its name and location varies by game and game configuration, so this function exposes the path that libloot uses.

**Returns** The file path.

virtual bool **IsActive**(const std::string &plugin) const = 0

Check if a plugin is active.

**Parameters** **plugin** – The filename of the plugin for which to check the active state.

**Returns** True if the plugin is active, false otherwise.

virtual std::vector<std::string> **GetLoadOrder**() const = 0

Get the current load order.

**Returns** A vector of plugin filenames in their load order.

virtual void **SetLoadOrder**(const std::vector<std::string> &loadOrder) = 0

Set the game's load order.

**Parameters** **loadOrder** – A vector of plugin filenames sorted in the load order to set.

class **loot::PluginInterface**

Represents a plugin file that has been parsed by LOOT.

### Public Functions

virtual std::string **GetName**() const = 0

Get the plugin's filename.

**Returns** The plugin filename.

virtual std::optional<float> **GetHeaderVersion**() const = 0

Get the value of the version field in the HEDR subrecord of the plugin's TES4 record.

**Returns** The value of the version field, or an empty optional if that value is NaN or could not be found.

virtual std::optional<std::string> **GetVersion**() const = 0

Get the plugin's version number from its description field.

The description field may not contain a version number, or LOOT may be unable to detect it. The description field parsing may fail to extract the version number correctly, though it functions correctly in all known cases.

**Returns** An optional containing a version string if one is found, otherwise an optional containing no value.

virtual std::vector<std::string> **GetMasters**() const = 0

Get the plugin's masters.

**Returns** The plugin's masters in the same order they are listed in the file.

virtual std::vector<Tag> **GetBashTags**() const = 0

Get any Bash Tags found in the plugin's description field.

**Returns** A set of Bash Tags. The order of elements in the set holds no semantics.

virtual std::optional<uint32\_t> **GetCRC**() const = 0

Get the plugin's CRC-32 checksum.

**Returns** An optional containing the plugin's CRC-32 checksum if the plugin has been fully loaded, otherwise an optional containing no value.

virtual bool **IsMaster**() const = 0

Check if the plugin's master flag is set.

**Returns** True if the master flag is set, false otherwise.

virtual bool **IsLightPlugin**() const = 0

Check if the plugin is a light plugin.

**Returns** True if plugin is a light plugin, false otherwise.

virtual bool **IsValidAsLightPlugin**() const = 0

Check if the plugin is or would be valid as a light plugin.

**Returns** True if the plugin is a valid light plugin or would be a valid light plugin, false otherwise.

virtual bool **IsEmpty**() const = 0

Check if the plugin contains any records other than its TES4 header.

**Returns** True if the plugin only contains a TES4 header, false otherwise.

virtual bool **LoadsArchive**() const = 0

Check if the plugin loads an archive (BSA/BA2 depending on the game).

**Returns** True if the plugin loads an archive, false otherwise.

virtual bool **DoRecordsOverlap**(const *PluginInterface* &plugin) const = 0

Check if two plugins contain a record with the same ID.

**Parameters** **plugin** – The other plugin to check for overlap with.

**Returns** True if the plugins both contain at least one record with the same ID, false otherwise.  
FormIDs are compared for all games apart from Morrowind, which doesn't have FormIDs and so has other identifying data compared.

## 4.6 Classes

class **loot::ConditionalMetadata**

A base class for metadata that can be conditional based on the result of evaluating a condition string.

Subclassed by *File*, *Message*, *Tag*

### Public Functions

**ConditionalMetadata**() = default

Construct a *ConditionalMetadata* object with an empty condition string.

**Returns** A *ConditionalMetadata* object.

explicit **ConditionalMetadata**(const std::string &condition)

Construct a *ConditionalMetadata* object with a given condition string.

**Parameters** **condition** – A condition string, as defined in the LOOT metadata syntax documentation.

**Returns** A *ConditionalMetadata* object.

bool **IsConditional**() const

Check if the condition string is non-empty.

**Returns** True if the condition string is not empty, false otherwise.

std::string **GetCondition**() const

Get the condition string.

**Returns** The object's condition string.

class `loot::Filename`

Represents a case-insensitive filename.

### Public Functions

`Filename()` = default

Construct a *Filename* using an empty string.

**Returns** A *Filename* object.

explicit `Filename(const std::string &filename)`

Construct a *Filename* using the given string.

**Returns** A *Filename* object.

explicit **operator** `std::string()` const

Get this *Filename* as a string.

class `loot::File` : public *ConditionalMetadata*

Represents a file in a game's Data folder, including files in subdirectories.

### Public Functions

`File()` = default

Construct a *File* with blank name, display and condition strings.

**Returns** A *File* object.

explicit `File(const std::string &name, const std::string &display = "", const std::string &condition = "", const std::vector<MessageContent> &detail = {})`

Construct a *File* with the given name, display name and condition strings.

#### Parameters

- **name** – The filename of the file.
- **display** – The name to be displayed for the file in messages, formatted using Common-Mark.
- **condition** – The *File*'s condition string.
- **detail** – The detail message content, which may be appended to any messages generated for this file. If multilingual, one language must be English.

**Returns** A *File* object.

*Filename* `GetName()` const

Get the filename of the file.

**Returns** The file's filename.

`std::string GetDisplayName()` const

Get the display name of the file.

**Returns** The file's display name.

`std::vector<MessageContent> GetDetail()` const

Get the detail message content of the file.

If this file causes an error message to be displayed, the detail message content should be appended to that message, as it provides more detail about the error (e.g. suggestions for how to resolve it).

class `loot::Group`

Represents a group to which plugin metadata objects can belong.

### Public Functions

`Group()` = default

Construct a *Group* with the name “default” and an empty set of groups to load after.

**Returns** A *Group* object.

explicit `Group`(const std::string &name, const std::vector<std::string> &afterGroups = {}, const std::string &description = "")

Construct a *Group* with the given name, description and set of groups to load after.

#### Parameters

- **name** – The group name.
- **afterGroups** – The names of groups this group loads after.
- **description** – A description of the group.

**Returns** A *Group* object.

std::string `GetName()` const

Get the name of the group.

**Returns** The group’s name.

std::string `GetDescription()` const

Get the description of the group.

**Returns** The group’s description.

std::vector<std::string> `GetAfterGroups()` const

Get the set of groups this group loads after.

**Returns** A set of group names.

### Public Static Attributes

static constexpr const char \***DEFAULT\_NAME** = "default"

The name of the group to which all plugins belong by default.

class `loot::Location`

Represents a URL at which the parent plugin can be found.

### Public Functions

`Location()` = default

Construct a *Location* with empty URL and name strings.

**Returns** A *Location* object.

explicit `Location`(const std::string &url, const std::string &name = "")

Construct a *Location* with the given URL and name.

#### Parameters

- **url** – The URL at which the plugin can be found.
- **name** – A name for the URL, eg. the page or site name.

**Returns** A *Location* object.

std::string **GetURL()** const  
Get the object's URL.

**Returns** A URL string.

std::string **GetName()** const  
Get the object's name.

**Returns** The name of the location.

class loot::MessageContent  
Represents a message's localised text content.

### Public Functions

**MessageContent()** = default  
Construct a *MessageContent* object with an empty English message string.

**Returns** A *MessageContent* object.

explicit **MessageContent**(const std::string &text, const std::string &language = *DEFAULT\_LANGUAGE*)  
Construct a *Message* object with the given text in the given language.

#### Parameters

- **text** – The message text.
- **language** – The language that the message is written in.

**Returns** A *MessageContent* object.

std::string **GetText()** const  
Get the message text.

**Returns** A string containing the message text.

std::string **GetLanguage()** const  
Get the message language.

**Returns** A code representing the language that the message is written in.

### Public Static Attributes

static constexpr const char \***DEFAULT\_LANGUAGE** = "en"  
The code for the default language assumed for message content, which is “en” (English).

class loot::Message : public *ConditionalMetadata*  
Represents a message with localisable text content.

## Public Functions

**Message()** = default

Construct a *Message* object of type 'say' with blank content and condition strings.

**Returns** A *Message* object.

explicit **Message**(const *MessageType* type, const std::string &content, const std::string &condition = "")

Construct a *Message* object with the given type, English content and condition string.

### Parameters

- **type** – The message type.
- **content** – The English message content text.
- **condition** – A condition string.

**Returns** A *Message* object.

explicit **Message**(const *MessageType* type, const std::vector<*MessageContent*> &content, const std::string &condition = "")

Construct a *Message* object with the given type, content and condition string.

### Parameters

- **type** – The message type.
- **content** – The message content. If multilingual, one language must be English.
- **condition** – A condition string.

**Returns** A *Message* object.

explicit **Message**(const *SimpleMessage* &message)

Construct a *Message* object from a *SimpleMessage* object.

**Parameters** **message** – The *SimpleMessage* object.

**Returns** A *Message* object.

*MessageType* **GetType()** const

Get the message type.

**Returns** The message type.

std::vector<*MessageContent*> **GetContent()** const

Get the message content.

**Returns** The message's *MessageContent* objects.

class loot::PluginCleaningData

Represents data identifying the plugin under which it is stored as dirty or clean.

## Public Functions

**PluginCleaningData()** = default

Construct a *PluginCleaningData* object with zero CRC, ITM count, deleted reference count and deleted navmesh count values, an empty utility string and no detail.

**Returns** A *PluginCleaningData* object.

explicit **PluginCleaningData**(uint32\_t crc, const std::string &utility)

Construct a *PluginCleaningData* object with the given CRC and utility, zero ITM count, deleted reference count and deleted navmesh count values and no detail.

### Parameters

- **crc** – The CRC of a plugin.
- **utility** – The utility that the plugin cleanliness was checked with.

**Returns** A *PluginCleaningData* object.

explicit **PluginCleaningData**(uint32\_t crc, const std::string &utility, const std::vector<*MessageContent*> &detail, unsigned int itm, unsigned int ref, unsigned int nav)

Construct a *PluginCleaningData* object with the given values.

### Parameters

- **crc** – A clean or dirty plugin's CRC.
- **utility** – The utility that the plugin cleanliness was checked with.
- **detail** – A vector of localised information message strings about the plugin cleanliness.
- **itm** – The number of Identical To Master records found in the plugin.
- **ref** – The number of deleted references found in the plugin.
- **nav** – The number of deleted navmeshes found in the plugin.

**Returns** A *PluginCleaningData* object.

uint32\_t **GetCRC()** const

Get the CRC that identifies the plugin that the cleaning data is for.

**Returns** A CRC-32 checksum.

unsigned int **GetITMCount()** const

Get the number of Identical To Master records in the plugin.

**Returns** The number of Identical To Master records in the plugin.

unsigned int **GetDeletedReferenceCount()** const

Get the number of deleted references in the plugin.

**Returns** The number of deleted references in the plugin.

unsigned int **GetDeletedNavmeshCount()** const

Get the number of deleted navmeshes in the plugin.

**Returns** The number of deleted navmeshes in the plugin.

std::string **GetCleaningUtility()** const

Get the name of the cleaning utility that was used to check the plugin.

**Returns** A cleaning utility name, possibly related information such as a version number and/or a CommonMark-formatted URL to the utility's download location.

std::vector<*MessageContent*> **GetDetail()** const

Get any additional informative message content supplied with the cleaning data, eg. a link to a cleaning guide or information on wild edits or manual cleaning steps.

**Returns** A vector of localised *MessageContent* objects.

class **loot::PluginMetadata**

Represents a plugin's metadata.

## Public Functions

**PluginMetadata()** = default

Construct a *PluginMetadata* object with a blank plugin name and no metadata.

**Returns** A *PluginMetadata* object.

explicit **PluginMetadata**(const std::string &name)

Construct a *PluginMetadata* object with no metadata for a plugin with the given filename.

**Parameters** **name** – The filename of the plugin that the object is constructed for.

**Returns** A *PluginMetadata* object.

void **MergeMetadata**(const *PluginMetadata* &plugin)

Merge metadata from the given *PluginMetadata* object into this object.

If an equal metadata object already exists in this *PluginMetadata* object, it is not duplicated. This object's group is replaced by the given object's group if the latter is explicit.

**Parameters** **plugin** – The plugin metadata to merge.

std::string **GetName()** const

Get the plugin name.

**Returns** The plugin name.

std::optional<std::string> **GetGroup()** const

Get the plugin's group.

**Returns** An optional containing the name of the group this plugin belongs to if it was explicitly set, otherwise an optional containing no value.

std::vector<*File*> **GetLoadAfterFiles()** const

Get the plugins that the plugin must load after.

**Returns** The plugins that the plugin must load after.

std::vector<*File*> **GetRequirements()** const

Get the files that the plugin requires to be installed.

**Returns** The files that the plugin requires to be installed.

std::vector<*File*> **GetIncompatibilities()** const

Get the files that the plugin is incompatible with.

**Returns** The files that the plugin is incompatible with.

std::vector<*Message*> **GetMessages()** const

Get the plugin's messages.

**Returns** The plugin's messages.

std::vector<*Tag*> **GetTags()** const

Get the plugin's Bash *Tag* suggestions.

**Returns** The plugin's Bash *Tag* suggestions.

`std::vector<PluginCleaningData> GetDirtyInfo() const`  
Get the plugin's dirty plugin information.

**Returns** The *PluginCleaningData* objects that identify the plugin as dirty.

`std::vector<PluginCleaningData> GetCleanInfo() const`  
Get the plugin's clean plugin information.

**Returns** The *PluginCleaningData* objects that identify the plugin as clean.

`std::vector<Location> GetLocations() const`  
Get the locations at which this plugin can be found.

**Returns** The locations at which this plugin can be found.

`void SetGroup(const std::string &group)`  
Set the plugin's group.

**Parameters** `group` – The name of the group this plugin belongs to.

`void UnsetGroup()`  
Unsets the plugin's group.

`void SetLoadAfterFiles(const std::vector<File> &after)`  
Set the files that the plugin must load after.

**Parameters** `after` – The files to set.

`void SetRequirements(const std::vector<File> &requirements)`  
Set the files that the plugin requires to be installed.

**Parameters** `requirements` – The files to set.

`void SetIncompatibilities(const std::vector<File> &incompatibilities)`  
Set the files that the plugin must load after.

**Parameters** `incompatibilities` – The files to set.

`void SetMessages(const std::vector<Message> &messages)`  
Set the plugin's messages.

**Parameters** `messages` – The messages to set.

`void SetTags(const std::vector<Tag> &tags)`  
Set the plugin's Bash *Tag* suggestions.

**Parameters** `tags` – The Bash *Tag* suggestions to set.

`void SetDirtyInfo(const std::vector<PluginCleaningData> &info)`  
Set the plugin's dirty information.

**Parameters** `info` – The dirty information to set.

`void SetCleanInfo(const std::vector<PluginCleaningData> &info)`  
Set the plugin's clean information.

**Parameters** `info` – The clean information to set.

`void SetLocations(const std::vector<Location> &locations)`  
Set the plugin's locations.

**Parameters** `locations` – The locations to set.

`bool HasNameOnly() const`  
Check if no plugin metadata is set.

**Returns** True if the group is implicit and the metadata containers are all empty, false otherwise.

bool **IsRegexPlugin()** const

Check if the plugin name is a regular expression.

**Returns** True if the plugin name contains any of the characters `: \*?|`, false otherwise.

bool **NameMatches**(const std::string &pluginName) const

Check if the given plugin name matches this plugin metadata object's name field.

If the name field is a regular expression, the given plugin name will be matched against it, otherwise the strings will be compared case-insensitively. The given plugin name must be literal, i.e. not a regular expression.

**Returns** True if the given plugin name matches this metadata's plugin name, false otherwise.

std::string **AsYaml()** const

Serialises the plugin metadata as YAML.

**Returns** The serialised plugin metadata.

class **loot::Tag** : public *ConditionalMetadata*

Represents a Bash *Tag* suggestion for a plugin.

## Public Functions

explicit **Tag()** = default

Construct a *Tag* object with an empty tag name suggested for addition, with an empty condition string.

**Returns** A *Tag* object.

explicit **Tag**(const std::string &tag, const bool isAddition = true, const std::string &condition = "")

Construct a *Tag* object with the given name, for addition or removal, with the given condition string.

### Parameters

- **tag** – The name of the Bash *Tag*.
- **isAddition** – True if the tag should be added, false if it should be removed.
- **condition** – A condition string.

**Returns** A *Tag* object.

bool **IsAddition()** const

Check if the tag should be added.

**Returns** True if the tag should be added, false if it should be removed.

std::string **GetName()** const

Get the tag's name.

**Returns** The tag's name.

class **loot::Vertex**

A class representing a plugin or group vertex in a path, and the type of the edge to the next vertex in the path if one exists.

## Public Functions

explicit **Vertex**(std::string name)

Construct a *Vertex* with the given name and no out edge.

**Parameters** **name** – The name of the plugin or group that this vertex represents.

explicit **Vertex**(std::string name, *EdgeType* outEdgeType)

Construct a *Vertex* with the given name and out edge type.

### Parameters

- **name** – The name of the plugin or group that this vertex represents.
- **outEdgeType** – The type of the edge going out from this vertex.

std::string **GetName**() const

Get the name of the plugin or group.

**Returns** The name of the plugin or group.

std::optional<*EdgeType*> **GetTypeOfEdgeToNextVertex**() const

Get the type of the edge going to the next vertex.

Each edge goes from the vertex that loads earlier to the vertex that loads later.

**Returns** The edge type.

## 4.7 Exceptions

class **loot::CyclicInteractionError** : public runtime\_error

An exception class thrown if a cyclic interaction is detected when sorting a load order.

### Public Functions

**CyclicInteractionError**(std::vector<*Vertex*> cycle)

Construct an exception detailing a plugin or group graph cycle.

**Parameters** **cycle** – A representation of the cyclic path.

std::vector<*Vertex*> **GetCycle**() const

Get a representation of the cyclic path.

Each *Vertex* is the name of a graph element (plugin or group) and the type of the edge going to the next *Vertex*. The last *Vertex* has an edge going to the first *Vertex*.

**Returns** A vector of *Vertex* elements representing the cyclic path.

class **ConditionSyntaxError** : public runtime\_error

An exception class thrown if invalid syntax is encountered when parsing a metadata condition.

class **FileAccessError** : public runtime\_error

An exception class thrown if an error is encountered while reading or writing a file.

class **loot::UndefinedGroupError** : public runtime\_error

An exception class thrown if group is referenced but is undefined.

## Public Functions

**UndefinedGroupError**(const std::string &groupName)

Construct an exception for an undefined group.

**Parameters** **groupName** – The name of the group that is undefined.

std::string **GetGroupName**() const

Get the name of the undefined group.

**Returns** A group name.

## 4.8 Error Categories

LOOT uses error category objects to identify errors with codes that originate in lower-level libraries.

const std::error\_category &loot::libloadorder\_category()

Get the error category that can be used to identify system\_error exceptions that are due to libloadorder errors.

**Returns** A reference to the static object of unspecified runtime type, derived from std::error\_category.

**CREDITS**

## VERSION HISTORY

### 6.1 0.19.0 - 2023-01-07

#### 6.1.1 Added

- Sorting now takes into account overlapping assets in BSAs/BA2s that are loaded by plugins. If two plugins don't make changes to the same record but load BSAs (or BA2s for Fallout 4) that contain data for the same asset path, the plugin that loads more assets will load first (unless that's contradicted by higher-priority data and metadata).
- `loot::GameInterface::GetActivePluginsFilePath()`, which returns the path of the file libloot reads to determine which plugins are active.
- `loot::EdgeType::masterListGroup`, `loot::EdgeType::userGroup`, `loot::EdgeType::recordOverlap` and `loot::EdgeType::assetOverlap`.

#### 6.1.2 Fixed

- Building libloot using CMake versions older than 3.24.
- A few potential null pointer dereferences.

#### 6.1.3 Changed

- Sorting has been heavily optimised, leading to sorting being about 58 times faster than libloot 0.18.3 with large load orders:
  - The plugin graph used during sorting has been split in two. As a result, any plugin data or metadata that would previously caused a cyclic interaction error due to contradicting a plugin's master flag being set is now silently ignored instead.
  - The tie-breaking stage has been completely overhauled. As a result, some ties may now be broken differently to how they were broken in previous versions of libloot.
  - `loot::GameInterface::LoadPlugins()` now checks plugin validity in parallel.
- Cyclic interaction errors now distinguish between group edges that involve user metadata and those that don't.
- `PluginInterface::DoFormIDsOverlap()` has been renamed to `loot::PluginInterface::DoRecordsOverlap()`.
- `loot::CyclicInteractionError::GetCycle()` is now `const`.
- `loot::UndefinedGroupError::GetGroupName()` is now `const`.
- Linux builds are now built using GCC 10 and now link against the `tbb` library.

### 6.1.4 Removed

- `EdgeType::group`
- `EdgeType::overlap`

## 6.2 0.18.3 - 2022-12-13

### 6.2.1 Fixed

- Resolved a CMake warning relating to policy CMP0135 when building libloot.
- Some of the documentation on `not` operators in the metadata syntax was outdated.
- The libloot Windows DLL did not include some file info fields that are required according to Microsoft's documentation. The `CompanyName`, `FileDescription`, `InternalName`, `OriginalFilename` and `ProductName` fields have been added.
- The libloot Windows DLL advertised its `FILETYPE` as `VFT_APP`, which has been changed to `VFT_DLL`.

### 6.2.2 Changed

- Sorting optimisations mean that sorting is now significantly faster (over 5 times faster in testing).
- Log message severities have been adjusted to reduce the verbosity at the “info” level and to move some messages between “debug” and “trace”.
- Release build archive names no longer include the output of `git describe`.
- Updated `spdlog` to v1.11.0.

## 6.3 0.18.2 - 2022-10-11

### 6.3.1 Fixed

- libloot will now use the correct local app data path for the Epic Games Store distribution of Skyrim Special Edition when no local app data path is passed to `loot::CreateGameHandle()`. Via `libloadorder`.

### 6.3.2 Changed

- Updated `libloadorder` to v13.3.0.

## 6.4 0.18.1 - 2022-10-01

### 6.4.1 Fixed

- libloot will now use the correct local app data path for the GOG distribution of Skyrim Special Edition when no local app data path is passed to `loot::CreateGameHandle()`. Via libloadorder.
- If Oblivion's `Oblivion.ini` could not be found or read, or if it did not contain the `bUseMyGamesDirectory` setting, the game's install path would be used as the parent directory for `plugins.txt`. libloot now correctly defaults to using the game's local app data directory, and only uses the install path if `bUseMyGamesDirectory=0` is found. Via libloadorder.

### 6.4.2 Changed

- When serialising plugin metadata as YAML, LOOT now:
  - Puts `url` before `group`
  - Serialises single-element lists using the flow style if the element would be serialised as a scalar value
  - Pads CRC hexadecimal values to always be 8 characters long (excluding the `0x` prefix)
  - Uses uppercase letters in CRC hexadecimal values.
- Updated esplugin to v4.0.0.
- Updated Google Test to v1.12.1.
- Updated libloadorder to v13.2.0.
- Updated loot-condition-interpreter to v2.3.1.
- Updated spdlog to v1.10.0.

## 6.5 0.18.0 - 2022-02-27

### 6.5.1 Added

- `loot::Group::DEFAULT_NAME` gives the default group name as a compile-time constant.
- `loot::ToSimpleMessages()` turns a `std::vector<Message>` into a `std::vector<SimpleMessage>` for a given language.
- `loot::GameInterface::IsLoadOrderAmbiguous()` exposes libloadorder's `lo_is_ambiguous()` function.

### 6.5.2 Fixed

- `loot::SimpleMessage` now uses an in-class initialiser to ensure that its `type` member variable is always initialised.
- Added missing virtual destructors to `loot::GameInterface`, `loot::DatabaseInterface` and `loot::PluginInterface`.
- Two versions that only differ by the presence and absence of pre-release identifiers were not correctly compared according to Semantic Versioning, which states that 1.0.0-alpha is less than 1.0.0. Via loot-condition-interpreter.
- Some missing API documentation and formatting issues.

### 6.5.3 Changed

- `loot::CreateGameHandle()` now returns a `std::unique_ptr<GameInterface>` instead of a `std::shared_ptr<GameInterface>`.
- `loot::GameInterface::GetDatabase()` now returns a `DatabaseInterface&` instead of a `std::shared_ptr<DatabaseInterface>`.
- `loot::GameInterface::GetPlugin()` now returns a `const PluginInterface*` instead of a `std::shared_ptr<const PluginInterface>`.
- `loot::GameInterface::GetLoadedPlugins()` now returns a `std::vector<const PluginInterface*>` instead of a `std::vector<std::shared_ptr<const PluginInterface>>`.
- `MessageContent::defaultLanguage` has been replaced with `loot::MessageContent::DEFAULT_LANGUAGE`, which is a compile-time constant.
- `File::ChooseDetail()`, `Message::GetContent(const std::string& language)`, `MessageContent::Choose()` and `PluginCleaningData::ChooseDetail()` have been replaced with `loot::SelectMessageContent()`.
- `Message::ToSimpleMessage()` has been replaced with `loot::ToSimpleMessage()`.
- `LootVersion` has been replaced with `loot::LIBLOOT_VERSION_MAJOR`, `loot::LIBLOOT_VERSION_MINOR`, `loot::LIBLOOT_VERSION_PATCH`, `loot::GetLiblootVersion()` and `loot::GetLiblootRevision()`.
- `loot::File::GetDisplayName()` is now a trivial accessor that only ever returns the value of the display name member variable and performs no character escaping.
- `loot::CyclicInteractionError` and `loot::UndefinedGroupError` have had their `const` member variables made non-`const`.
- `loot::ConditionalMetadata`, `loot::File`, `loot::Filename`, `loot::Group`, `loot::Location`, `loot::Message`, `loot::MessageContent`, `loot::PluginCleaningData`, `loot::PluginMetadata` and `loot::Tag` have had their user-defined default constructors replaced by use of in-class initialisers and defaulted default constructors.
- The `<` and `==` operator overloads for `loot::File`, `loot::Group`, `loot::Location`, `loot::Message`, `loot::MessageContent`, `loot::PluginCleaningData` and `loot::Tag` have become non-member functions.
- The performance of `loot::PluginMetadata::NameMatches()` has been greatly improved by not constructing a new regex object every time the function is called.
- Mentions of GitHub Flavored Markdown have been replaced with CommonMark, as LOOT now uses the latter instead of the former.
- Updated loot-condition-interpreter to v2.3.0.

### 6.5.4 Removed

- `ConditionalMetadata::ParseCondition()`
- `PluginMetadata::NewMetadata()`
- All Git-related functionality has been removed, including the libgit2 dependency and the following API items:
  - `loot::UpdateFile()`
  - `loot::GetFileRevision()`
  - `loot::IsLatestFile()`

- `loot::libgit2_category()`
- `loot::GitStateError`
- `loot::FileRevision`

## 6.6 0.17.3 - 2022-01-02

### 6.6.1 Added

- `PluginMetadata::AsYaml` can be used to serialise plugin metadata as YAML.

### 6.6.2 Changed

- Plugin name regular expression objects are now cached between calls to `DatabaseInterface::LoadLists`.

## 6.7 0.17.2 - 2021-12-24

### 6.7.1 Fixed

- A missing `<string>` include in `include/loot/struct/simple_message.h`.
- Invalid configuration causing Read The Docs to fail to build the documentation.

### 6.7.2 Changed

- Updated `libgit2` to v1.3.0.

## 6.8 0.17.1 - 2021-11-13

### 6.8.1 Fixed

- Out-of-bounds array access that could occur in some situations and which could cause crashes in Linux builds.

## 6.9 0.17.0 - 2021-09-24

### 6.9.1 Added

- `DatabaseInterface::LoadLists` now accepts an optional third parameter that is the path to a masterlist prelude file to load. If loaded, it will be used to replace the value of the prelude in the loaded masterlist (if the masterlist has a prelude).
- The `Message` class has gained a constructor that takes a `SimpleMessage`.
- The `File` class has been gained support for the metadata structure's new `detail` field, adding:
  - An optional `const std::vector<MessageContent>&` parameter to the multiple-parameter constructor.

- A new `File::GetDetail` member function.
- A new `File::ChooseDetail` member function.

### 6.9.2 Changed

- `MasterlistInfo` has been renamed to `FileRevision`, and its `revision_id` and `revision_date` fields are now named `id` and `date` respectively.
- The `UpdateMasterlist`, `GetMasterlistRevision` and `IsLatestMasterlist` member functions have been moved out of `DatabaseInterface` and are now free functions named `UpdateFile`, `GetFileRevision` and `IsLatestFile` respectively.
- `PluginInterface::GetHeaderVersion` now returns a `std::optional<float>` instead of a `float`. The return value is `std::nullopt` if no header version field was found or if its value was NaN.
- Sorting now checks for cycles before adding overlap edges, so that any cycles are caught before the slowest steps in the sorting process.
- `PluginCleaningData::GetInfo()` has been renamed to `PluginCleaningData::GetDetail()`.
- `PluginCleaningData::ChooseInfo()` has been renamed to `PluginCleaningData::ChooseDetail()`.
- All API functions that returned a `MessageContent` or `SimpleMessage` now return a `std::optional<MessageContent>` or `std::optional<SimpleMessage>` respectively. This affects the following member functions:
  - `Message::GetContent`
  - `Message::ToSimpleMessage`
  - `MessageContent::Choose`
  - `PluginCleaningData::ChooseDetail`
- Updated `libgit2` to v1.1.1.
- Updated Google Test to v1.11.0.
- Updated `spdlog` to v1.9.2.
- Updated `yaml-cpp` to v0.7.0+merge-key-support.1.

### 6.9.3 Removed

- `PluginInterface::IsLightMaster`
- `PluginInterface::IsValidAsLightMaster`
- Updating the masterlist no longer reloads it, the masterlist must now be reloaded separately.
- Masterlist update no longer supports rolling back through revisions until a revision that can be successfully loaded is found.

## 6.10 0.16.3 - 2021-05-06

### 6.10.1 Added

- `PluginInterface::IsLightPlugin` as a more accurately named equivalent to `PluginInterface::IsLightMaster`.
- `PluginInterface::IsValidAsLightPlugin` as a more accurately named equivalent to `PluginInterface::IsValidAsLightMaster`.
- Support for parsing inverted metadata conditions (`not (<expression>)`). Note however that this is not yet part of any released version of LOOT's metadata syntax and must not be used where compatibility with older releases of LOOT is required. Via `loot-condition-interpreter`.

### 6.10.2 Changed

- `loot::MessageContent::Choose` now compares locale and language codes so that if an exact match is not present but a more or less specific match is present, that will be preferred over the default language message content.
- Regular expression functions in metadata conditions now handle ghosted plugins in the same way as their path function counterparts.
- Updated `esplugin` to v3.5.0.
- Updated `libloadorder` to v13.0.0.
- Updated `loot-condition-interpreter` to v2.2.1.
- Updated `spdlog` to v1.8.5.

### 6.10.3 Fixed

- `.ghost` file extensions are no longer recursively trimmed when checking if a file has a valid plugin file extension during metadata condition evaluation. Via `loot-condition-interpreter`.
- When looking for a plugin file matching a path during metadata condition evaluation, a `.ghost` extension is only added to the path if one was not already present. Via `loot-condition-interpreter`.
- When comparing versions during metadata condition evaluation, the comparison now compares numeric against non-numeric release identifiers (and vice versa) by comparing the numeric value against the numeric value of leading digits in the non-numeric value, and treating the latter as greater if the two numeric values are equal. The numeric value is treated as less than the non-numeric value if the latter has no leading digits. Previously all non-numeric identifiers were always greater than any numeric identifier. For example, 78b was previously considered to be greater than 86, but is now considered to be less than 86. Via `loot-condition-interpreter`.
- Linux builds did not correctly handle case-insensitivity of plugin names during sorting on filesystems with case folding enabled.

## 6.10.4 Deprecated

- `PluginInterface::IsLightMaster`: use `PluginInterface::IsLightPlugin` instead.
- `PluginInterface::IsValidAsLightMaster`: use `PluginInterface::IsValidAsLightPlugin` instead.

## 6.11 0.16.2 - 2021-02-13

### 6.11.1 Changed

- Updated libgit2 to v1.1.0.
- Updated loot-condition-interpreter to v2.1.2.
- Updated Boost to v1.72.0.
- Linux releases are now built on GitHub Actions.
- Masterlist updates can no longer be fetched using SSH URLs. This support was never tested or documented.

## 6.12 0.16.1 - 2020-08-22

### 6.12.1 Fixed

- `File::GetDisplayName()` now escapes ASCII punctuation characters when returning the file's name, i.e. when no display name is explicitly set. For example, `File("plugin.esp").GetDisplayName()` will now return `plugin\esp`.

## 6.13 0.16.0 - 2020-07-12

### 6.13.1 Added

- The `!=`, `>`, `<=` and `>=` comparison operators are now implemented for `loot::File`, `loot::Location`, `loot::Message`, `loot::MessageContent`, `loot::PluginCleaningData` and `loot::Tag`.
- The `!=`, `<`, `>`, `<=` and `>=` comparison operators are now implemented for `loot::Group`.
- A new `Filename` class for representing strings handled as case-insensitive filenames.
- `PluginMetadata::NameMatches()` checks if the given plugin filename matches the plugin name of the metadata object it is called on. If the plugin metadata name is a regular expression, the given plugin filename will be matched against it, otherwise the comparison is case-insensitive equality.

## 6.13.2 Changed

- `File::GetName()` now returns a `Filename` instead of a `std::string`.
- `GetGroups` and `GetUserGroups` now return `std::vector<Group>` instead of `std::unordered_set<Group>`.
- `SetUserGroups` now takes a `const std::vector<Group>&` instead of a `const std::unordered_set<std::string>&`.
- `loot::Group`'s three-argument constructor now takes a `const std::vector<std::string>&` instead of a `const std::unordered_set<std::string>&` as its second parameter.
- `GetAfterGroups` now returns a `std::vector<std::string>` instead of a `std::unordered_set<std::string>`.
- `std::set<>` usage has been replaced by `std::vector<>` throughout the public API. This affects the following functions:
  - `PluginInterface::GetBashTags()`
  - `DatabaseInterface::GetKnownBashTags()`
  - `GameInterface::GetLoadedPlugins()`
  - `PluginMetadata::GetLoadAfterFiles()`
  - `PluginMetadata::SetLoadAfterFiles()`
  - `PluginMetadata::GetRequirements()`
  - `PluginMetadata::SetRequirements()`
  - `PluginMetadata::GetIncompatibilities()`
  - `PluginMetadata::SetIncompatibilities()`
  - `PluginMetadata::GetTags()`
  - `PluginMetadata::SetTags()`
  - `PluginMetadata::GetDirtyInfo()`
  - `PluginMetadata::SetDirtyInfo()`
  - `PluginMetadata::GetCleanInfo()`
  - `PluginMetadata::SetCleanInfo()`
  - `PluginMetadata::GetLocations()`
  - `PluginMetadata::SetLocations()`
- `loot::File`, `loot::Location`, `loot::Message`, `loot::MessageContent`, `loot::PluginCleaningData`, `loot::Tag` and `loot::Group` now implement their comparison operators by comparing all their fields (including inherited fields), using the same operator for the fields. For example, comparing two `loot::File` objects using `==` will now compare each of their fields using `==`.
- When loading plugins, the speed at which LOOT identifies their corresponding archive files (`*.bsa` or `.ba2`, depending on the game) has been improved.

### 6.13.3 Removed

- `PluginMetadata::IsEnabled()` and `PluginMetadata::SetEnabled()`, as it is no longer possible to disable plugin metadata (though doing so never had any effect).
- `PluginMetadata` no longer implements the `==` or `!=` comparison operators.
- `std::hash` is no longer specialised for `loot::Group`.

### 6.13.4 Fixed

- `LoadsArchive` now correctly identifies the BSAs that a Skyrim SE or Skyrim VR loads. This assumes that Skyrim VR plugins load BSAs in the same way as Skyrim SE. Previously LOOT would use the same rules as the Fallout games for Skyrim SE or VR, which was incorrect.
- Some operations involving loaded plugins or copies of game interface objects could potentially cause data races due to a lack of mutex locking in some data read operations.
- Copying a game interface object did not copy its cached archive files, leaving the new copy with no cached archive files.

## 6.14 0.15.2 - 2020-06-14

### 6.14.1 Changed

- `MergeMetadata` now only uses the group value of the given metadata object if there is not already one set, matching the behaviour for all other merged metadata.
- Updated `esplugin` to v3.3.1.
- Updated `libgit2` to v1.0.1.
- Updated `loot-condition-interpreter` to v2.1.1.
- Updated `spdlog` to v1.6.1.

### 6.14.2 Fixed

- `GetPluginMetadata` preferred masterlist metadata over userlist metadata when merging them, which was the opposite of the intended behaviour.

## 6.15 0.15.1 - 2019-12-07

### 6.15.1 Changed

- The range of FormIDs that are recognised as valid in light masters has been extended for Fallout 4 plugins, from between 0x800 and 0xFFF inclusive to between 0x001 and 0xFFF inclusive, to reflect the extended range supported by Fallout 4 v1.10.162.0.0. The valid range for Skyrim Special Edition plugins is unchanged. Via `esplugin`.
- Updated `esplugin` to v3.3.0.

## 6.16 0.15.0 - 2019-11-05

### 6.16.1 Changed

- libloot now supports v0.15 of the metadata syntax.
- The order of the plugins passed to `SortPlugins` is now used as the current load order during sorting. The order of plugins passed in did not previously have any impact.
- Constructors for the following classes and structs are now **explicit**:
  - `loot::ConditionalMetadata`
  - `loot::File`
  - `loot::Group`
  - `loot::Location`
  - `loot::Message`
  - `loot::MessageContent`
  - `loot::PluginCleaningData`
  - `loot::PluginMetadata`
  - `loot::Tag`
  - `loot::MasterlistInfo`
  - `loot::Vertex`
- Updated loot-condition-interpreter to v2.1.0.
- Updated spdlog to v1.4.2.

### 6.16.2 Removed

- `InitialiseLocale()`
- `PluginMetadata::GetLowercasedName()`
- `PluginMetadata::GetNormalizedName()`

### 6.16.3 Fixed

- libloot was unable to extract versions from plugin descriptions containing `version:` followed by whitespace and one or more digits.
- libloot did not error if masterlist metadata defined a group that loaded after another group that was not defined in the masterlist, but which was defined in user metadata. This was unintentional, and now all groups mentioned in masterlist metadata must now be defined in the masterlist.
- Build errors on Linux using GCC 9 and ICU 61+.

## 6.17 0.14.10 - 2019-09-06

### 6.17.1 Changed

- Improved the sorting process for Morrowind. Previously, sorting was unable to determine if a Morrowind plugin contained any records overriding those of its masters, and so added no overlap edges between Morrowind plugins when sorting. Sorting now counts override records by comparing plugins against their masters, giving the same results as for other games.

However, unlike for other games, this requires all a plugin's masters to be installed. If a plugin's masters are missing, the plugin's total record count will be used as if it was the plugin's override record count to ensure that sorting can still proceed, albeit with potentially reduced accuracy.

- Updated esplugin to v3.2.0.
- Updated libgit2 to v0.28.3.

## 6.18 0.14.9 - 2019-07-23

### 6.18.1 Fixed

- Regular expressions in condition strings are now prefixed with `^` and suffixed with `$` before evaluation to ensure that only exact matches to the given expression are found. Via `loot-condition-interpreter`.

### 6.18.2 Changed

- Updated `loot-condition-interpreter` to v2.0.0.

## 6.19 0.14.8 - 2019-06-30

### 6.19.1 Fixed

- Evaluating `version()` and `product_version()` conditions will no longer error if the given executable has no version fields. Instead, it will be evaluated as having no version. Via `loot-condition-interpreter`.
- Sorting would not preserve the existing relative positions of plugins that had no relative positioning enforced by plugin data or metadata, if one or both of their filenames were not case-sensitively equal to their entries in `plugins.txt` / `loadorder.txt`. Load order position comparison is now correctly case-insensitive.

### 6.19.2 Changed

- Improved load order sorting performance.
- Updated `loot-condition-interpreter` to v2.0.0.

## 6.20 0.14.7 - 2019-06-13

### 6.20.1 Fixed

- Filename comparisons on Windows now has the same locale-invariant case insensitivity behaviour as Windows itself, instead of being locale-dependent.
- Filename comparisons on Linux now use ICU case folding to give locale-invariant results that are much closer to Windows' case insensitivity, though still not identical.

### 6.20.2 Changed

- Updated libgit2 to v0.28.2.

## 6.21 0.14.6 - 2019-04-24

### 6.21.1 Added

- Support for TES III: Morrowind using `GameType: :tes3`. The sorting process for Morrowind is slightly different than for other games, because LOOT cannot currently detect when plugins overlap. As a result, LOOT is much less likely to suggest load order changes.

### 6.21.2 Changed

- Updated esplugin to v2.1.2.
- Updated loot-condition-interpreter to v1.3.0.

### 6.21.3 Fixed

- LOOT would unnecessarily ignore intermediate plugins in a non-master to master cycle involving groups, leading to unexpected results when sorting plugins.

## 6.22 0.14.5 - 2019-02-27

### 6.22.1 Changed

- Updated libgit2 to v0.28.1.
- Updated libloadorder to v12.0.1.
- Updated spdlog to v1.3.1.

### 6.22.2 Fixed

- `HearthFires.esm` was not recognised as a hardcoded plugin on case-sensitive filesystems, causing a cyclic interaction error when sorting Skyrim or Skyrim SE (via `libloadorder`).

## 6.23 0.14.4 - 2019-01-27

### 6.23.1 Added

- Added `UnsetGroup` to `PluginMetadata`.

## 6.24 0.14.3 - 2019-01-27

### 6.24.1 Changed

- Condition parsing now errors if it does not consume the whole condition string. Via `loot-condition-interpreter`.
- Removed a few unhelpful log statements and changed the verbosity level of others.
- Updated `loot-condition-interpreter` to v1.2.2.

### 6.24.2 Fixed

- Conditions were not parsed past the first instance of `file(<regex>)`, `active(<regex>)`, `many(<regex>)` or `many_active(<regex>)`. Via `loot-condition-interpreter`.
- `loot::CreateGameHandle()` could crash when trying to check if the given paths are symlinks. If a check fails, LOOT will assume the path is not a symlink.

## 6.25 0.14.2 - 2019-01-20

### 6.25.1 Changed

- Updated `loot-condition-interpreter` to v1.2.1.
- Updated `spdlog` to v1.3.0.

### 6.25.2 Fixed

- An error when loading plugins with a file present in the plugins directory that has a filename containing characters that cannot be represented in the system code page.
- An error when trying to read the version of an executable that does not have a US English version information resource. Executable versions are now read from the file's first version information resource, whatever its language. Via `loot-condition-interpreter`.

## 6.26 0.14.1 - 2018-12-23

### 6.26.1 Changed

- Updated loot-condition-interpreter to v1.2.0.

### 6.26.2 Fixed

- Product version conditions read from executables' VS\_FIXEDFILEINFO structure, so the versions read did not match the versions displayed by Windows' File Explorer. Product versions are now read from executables' VS\_VERSIONINFO structure, using the ProductVersion key. Via loot-condition-interpreter.
- The release date in the metadata syntax changelog for v0.14 was “Unreleased”.

## 6.27 0.14.0 - 2018-12-09

### 6.27.1 Added

- `GetHeaderVersion` to get the value of the version field in the HEDR subrecord of a plugin's TES4 record.
- `IsValidAsLightMaster` to check if a light master is valid or if a non-light-master plugin would be valid with the light master flag or `.esl` extension. Validity is defined as having no new records with a FormID object index greater than `0xFFFF`.
- `GetGroupsPath` to return the path between two given groups that maximises the user metadata and minimises the masterlist metadata involved.
- `loot::Vertex` to represent a plugin or group vertex in a sorting graph path.
- `loot::EdgeType` to represent the type of the edge between two vertices in a sorting graph. Each edge type indicates the type of data it was sourced from.

### 6.27.2 Changed

- Renamed the library from “the LOOT API” to “libloot” to avoid confusion between the name of the library and the API that it provides. The library filename is changed so that the `loot_api` part is now `loot`, e.g. `loot.dll` on Windows and `libloot.so` on Linux.
- `CyclicInteractionError` has had its constructor and methods completely replaced to provide a more detailed and flexible representation of the cyclic path that it reports.
- `UndefinedGroupError::getGroupName()` has been renamed to `UndefinedGroupError::GetGroupName()` for consistency with other API method names.
- `LootVersion::string()` has been renamed to `LootVersion::GetVersionString()` for consistency with other API method names.
- `GetPluginMetadata` and `GetPluginUserMetadata` now return `std::optional<PluginMetadata>` to differentiate metadata being found or not. Note that the `PluginMetadata` value may still return true for `HasNameOnly` if a metadata entry exists but has no content other than the plugin name.
- `GetGroup` now returns `std::optional<std::string>` to indicate when there is no group metadata explicitly set, to simplify distinguishing between explicit and implicit default group membership.

- `GetVersion` now returns `std::optional<std::string>` to differentiate between there being no version and the version being an empty string, though the latter should never occur.
- `GetCRC` now returns `std::optional<uint32_t>` to differentiate between there being no CRC calculated and the CRC somehow being zero (which should never occur).
- Filesystem paths are now represented in the API by `std::filesystem::path` values instead of `std::string` values. This affects the following functions:
  - `loot::CreateGameHandle()`
  - `LoadLists`
  - `WriteUserMetadata`
  - `WriteMinimalList`
  - `UpdateMasterlist`
  - `GetMasterlistRevision`
  - `IsLatestMasterlist`
- The metadata condition parsing, evaluation and caching code and the pseudosem dependency have been replaced by a dependency on `loot-condition-interpreter`, which provides more granular caching and more opportunity for future enhancements.
- The API now supports v0.14 of the metadata syntax.
- Updated C++ version required to C++17. This means that Windows builds now require the MSVC 2017 runtime redistributable to be installed.
- Updated esplugin to v2.1.1.
- Updated libloadorder to v12.0.0.
- Updated libgit2 to v0.27.7.
- Updated spdlog to v1.2.1.

### 6.27.3 Removed

- `PluginInterface::GetLowercasedName()`, as the case folding behaviour LOOT uses is not necessarily appropriate for all use cases, so it's up to the client to lowercase according to their own needs.

### 6.27.4 Fixed

- BSAs/BA2s loaded by non-ASCII plugins for Oblivion, Fallout 3, Fallout: New Vegas and Fallout 4 may not have been detected due to incorrect case-insensitivity handling.
- Fixed incorrect case-insensitivity handling for non-ASCII plugin filenames and File metadata names.
- `FileVersion` and `ProductVersion` properties were not set in the DLL since v0.11.0.
- Path equivalence checks could be inaccurate as they were using case-insensitive string comparisons, which may not match filesystem behaviour. Filesystem equivalence checks are now used to improve correctness.
- Errors due to filesystem permissions when cloning a new masterlist repository into an existing game directory. Deleting the temporary directory is now deferred until after its contents have been copied into the game directory, and if an error is encountered when deleting the temporary directory, it is logged but does not cause the masterlist update to fail.

- An error creating a game handle for Skyrim if `loadorder.txt` is not encoded in UTF-8. In this case, libloadorder will now fall back to interpreting its contents as encoded in Windows-1252, to match the behaviour when reading the load order state.

## 6.28 0.13.8 - 2018-09-24

### 6.28.1 Fixed

- Filesystem errors when trying to set permissions during a masterlist update that clones a new repository.

## 6.29 0.13.7 - 2018-09-10

### 6.29.1 Changed

- Significantly improve plugin loading performance by scanning for BSAs/BA2s once instead of for each plugin.
- Improve performance of metadata evaluation by caching CRCs with the same cache lifetime as condition results.
- Improve performance of sorting when it involves long plugin interaction chains.
- Updated esplugin to v2.0.1.
- Updated libgit2 to v0.27.4.
- Updated libloadorder v11.4.1.
- Updated spdlog to v1.1.0.
- Updated yaml-cpp to 0.6.2+merge-key-support.2.

### 6.29.2 Fixed

- Fallout 4's *DLCUltraHighResolution.esm* is now handled as a hardcoded plugin (via libloadorder).

## 6.30 0.13.6 - 2018-06-29

### 6.30.1 Changed

- Tweaked masterlist repository cloning to avoid undefined behaviour.
- Updated Boost to v1.67.0.
- Updated esplugin to v2.0.0.
- Updated libgit2 to v0.27.2.
- Updated libloadorder to v11.4.0.

## 6.31 0.13.5 - 2018-06-02

### 6.31.1 Changed

- Sorting now enforces hardcoded plugin positions, sourcing them through libloadorder. This avoids the need for often very verbose metadata entries, particularly for Creation Club plugins.
- Updated libgit2 to v0.27.1. This includes a security fix for CVE-2018-11235, but LOOT API's usage is not susceptible. libgit2 is not susceptible to CVE-2018-11233, another Git vulnerability which was published on the same day.
- Updated libloadorder to v11.3.0.
- Updated spdlog to v0.17.0.
- Updated esplugin to v1.0.10.

## 6.32 0.13.4 - 2018-06-02

### 6.32.1 Fixed

- `NewMetadata` now uses the passed plugin's group if the calling plugin's group is implicit, and sets the group to be implicit if the two plugins' groups are equal.

## 6.33 0.13.3 - 2018-05-26

### 6.33.1 Changed

- Improved cycle avoidance when resolving evaluating plugin groups during sorting. If enforcing the group difference between two plugins would cause a cycle and one of the plugins' groups is the default group, that plugin's group will be ignored for all plugins in groups between default and the other plugin's group.
- The masterlist repository cloning process no longer moves LOOT's game folders, so if something goes wrong the process fails more safely.
- The LOOT API is now built with debugging information on Windows, and its PDB is included in build archives.
- Updated libloadorder to v11.2.2.

### 6.33.2 Fixed

- Various filesystem-related issues that could be encountered when updating masterlists, including failure due to file handles being left open while attempting to remove.
- Building the esplugin and libloadorder dependencies using Rust 1.26.0, which included a [regression](#) to workspace builds.

## 6.34 0.13.2 - 2018-04-29

### 6.34.1 Changed

- Updated libloadorder to v11.2.1.

### 6.34.2 Fixed

- Incorrect load order positions were given for light-master-flagged .esp plugins when getting the load order (via libloadorder).

## 6.35 0.13.1 - 2018-04-09

### 6.35.1 Added

- Support for Skyrim VR using `GameType::tes5vr`.

### 6.35.2 Changed

- Updated libloadorder to v11.2.0.

## 6.36 0.13.0 - 2018-04-02

### 6.36.1 Added

- Group metadata as a replacement for priority metadata. Each plugin belongs to a group, and a group can load after other groups. Plugins belong to the `default` group by default.
  - Added the `loot::Group` class to represent a group.
  - Added `loot::UndefinedGroupError`.
  - Added `GetGroups`, `GetUserGroups` and `SetUserGroups`.
  - Added `GetGroup`, `IsGroupExplicit` and `SetGroup`.
  - Updated `MergeMetadata` to replace the existing group with the given object's group if the latter is explicit.
  - Updated `NewMetadata` to return an object using the called object's group.
  - Updated `HasNameOnly` to check the group is implicit.
  - Updated `SortPlugins` to take into account plugin groups.

### 6.36.2 Changed

- LoadPlugins and SortPlugins no longer load the current load order state, so LoadCurrentLoadOrderState must be called separately.
- Updated libgit2 to v0.27.0.
- Updated libloadorder to v11.1.0.

### 6.36.3 Removed

- Support for local and global plugin priorities.
  - Removed the `loot::Priority` class.
  - Removed `PluginMetadata::GetLocalPriority()`, `PluginMetadata::GetGlobalPriority()`, `PluginMetadata::SetLocalPriority()` and `PluginMetadata::SetGlobalPriority()`
  - Priorities are no longer taken into account when sorting plugins.

### 6.36.4 Fixed

- An error when applying a load order for Morrowind, Oblivion, Fallout 3 or Fallout: New Vegas when a plugin had a timestamp earlier than 1970-01-01 00:00:00 UTC (via libloadorder).
- An error when loading the current load order for Skyrim with a `loadorder.txt` incorrectly encoded in Windows-1252 (via libloadorder).

## 6.37 0.12.5 - 2018-02-17

### 6.37.1 Changed

- Updated esplugin to v1.0.9.
- Updated libgit2 to v0.26.3. This enables TLS 1.2 support on Windows 7, so users shouldn't need to manually enable it themselves.

## 6.38 0.12.4 - 2018-02-17

### 6.38.1 Fixed

- Loading or saving a load order could be very slow because the plugins directory was scanned recursively, which is unnecessary. In the reported case, this fix caused saving a load order to go from 23 seconds to 43 milliseconds (via libloadorder).
- Plugin parsing errors were being logged with trace severity, they are now logged as errors.
- Saving a load order for Oblivion, Fallout 3 or Fallout: New Vegas now updates plugin access times to the current time for correctness (via libloadorder).

### 6.38.2 Changed

- `GameInterface::SetLoadOrder()` now errors if passed a load order that does not contain all installed plugins. The previous behaviour was to append any missing plugins, but this was undefined and could cause unexpected results (via `libloadorder`).
- Performance improvements for load order operations, benchmarked at 2x to 150x faster (via `libloadorder`).
- Updated mentions of `libespm` in error messages to mention `esplugin` instead.
- Updated `libloadorder` to v11.0.1.
- Updated `spdlog` to v0.16.3.

## 6.39 0.12.3 - 2018-02-04

### 6.39.1 Added

- Support for Fallout 4 VR via the new `loot::GameType::fo4vr` game type.

### 6.39.2 Fixed

- `loot::CreateGameHandle()` no longer accepts an empty game path string, and no longer has a default value for its game path parameter, as using an empty string as the game path is invalid and always causes an exception to be thrown.

### 6.39.3 Changed

- Added an empty string as the default value of `loot::InitialiseLocale`'s string parameter.
- Updated `esplugin` to v1.0.8.
- Updated `libloadorder` to v10.1.0.

## 6.40 0.12.2 - 2017-12-24

### 6.40.1 Fixed

- Plugins with a `.esp` file extension that have the light master flag set are no longer treated as masters when sorting, so they can have other `.esp` files as masters without causing cyclic interaction sorting errors.

## 6.40.2 Changed

- Downgraded Boost to 1.63.0 to take advantage of pre-built binaries on AppVeyor.

## 6.41 0.12.1 - 2017-11-23

### 6.41.1 Added

- Support for identifying Creation Club plugins using `Skyrim.ccc` and `Fallout4.ccc` (via `libloadorder`).

### 6.41.2 Changed

- Update `esplugin` to v1.0.7.
- Update `libloadorder` to v10.0.4.

## 6.42 0.12.0 - 2017-11-03

### 6.42.1 Added

- Support for light master (`.es1`) plugins.
- `LoadCurrentLoadOrderState` in `loot::GameInterface` to expose load order cache management to clients, as `libloadorder` no longer internally manages it.
- `loot::SetLoggingCallback()` to allow clients to handle the LOOT API's logging statements themselves.
- Logging of `libloadorder` error details.

### 6.42.2 Changed

- `LoadPlugins` now loads the current load order state before loading plugins.
- Added a *condition* string field to `SimpleMessage`.
- Replaced `libespm` dependency with `esplugin` v1.0.6. This significantly improves safety and sorting performance, especially for large load orders.
- Updated `libloadorder` to v10.0.3. This significantly improves safety and the performance of load order operations, at the expense of exposing cache management to the client.
- Replaced `Boost.Log` with `spdlog` v0.14.0, removing dependencies on several other Boost libraries in the process.
- Updated `libgit2` to v0.26.0.
- Update Boost to v1.65.1.

### 6.42.3 Removed

- `DatabaseInterface::EvalLists()` as it was superseded in v0.11.0 by the ability to evaluate conditions when getting general messages and individual plugins' metadata, which is more efficient.
- `SetLoggingVerbosity()` and `SetLogFile()` as they have been superseded by the new `loot::SetLoggingCallback()` function.
- The `loot/yaml/*` headers containing LOOT's internal YAML conversion functions are no longer exposed alongside the API headers.
- The `loot/windows_encoding_converters.h` header is no longer exposed alongside the API headers.

### 6.42.4 Fixed

- Formatting in metadata documentation.
- Saving metadata wrote entries in an inconsistent order.
- Clang build errors.

## 6.43 0.11.1 - 2017-06-19

### 6.43.1 Fixed

- A crash would occur when loading a plugin that had invalid data past its header. Such plugins are now just silently ignored.
- `loot::CreateGameHandle()` would not resolve game or local data paths that are junction links correctly, which caused problems later when trying to perform actions such as loading plugins.
- Performing a masterlist update on a branch where the remote and local histories had diverged would fail. The existing local branch is now discarded and the remote branch checked out anew, as intended.

## 6.44 0.11.0 - 2017-05-13

### 6.44.1 Added

- New functions to `loot::DatabaseInterface`:
  - `WriteUserMetadata`
  - `GetKnownBashTags`
  - `GetGeneralMessages`
  - `GetPluginMetadata`
  - `GetPluginUserMetadata`
  - `SetPluginUserMetadata`
  - `DiscardPluginUserMetadata`
  - `DiscardAllUserMetadata`
  - `IsLatestMasterlist`

- A `loot::GameInterface` pure abstract class that exposes methods for accessing game-specific functionality.
- A `loot::PluginInterface` pure abstract class that exposes methods for accessing plugin file data.
- The `loot::SetLoggingVerbosity` and `loot::SetLogFile` functions and `loot::LogVerbosity` enum for controlling the API's logging behaviour.
- An `loot::InitialiseLocale` function that must be called to configure the API's locale before any of its other functionality is used.
- LOOT's internal metadata classes are now exposed as part of the API.

## 6.44.2 Changed

- Renamed `loot::CreateDatabase()` to `loot::CreateGameHandle()`, and changed its signature so that it returns a shared pointer to a `loot::GameInterface` instead of a shared pointer to a `loot::DatabaseInterface`.
- Moved `SortPlugins` into `loot::GameInterface`.
- Some `loot::DatabaseInterface` methods are now const:
  - `WriteMinimalList`
  - `GetMasterlistRevision`
- LOOT's internal YAML conversion functions have been refactored into the `include/loot/yaml` directory, but they are not really part of the API. They're only exposed so that they can be shared between the API and LOOT application without introducing another component.
- LOOT's internal string encoding conversion functions have been refactored into the `include/loot/windows_encoding_converters.h` header, but are not really part of the API. They're only exposed so that they can be shared between the API and LOOT application without introducing another component.
- Metadata is now cached more efficiently, reducing the API's memory footprint.
- Log timestamps now have microsecond precision.
- Updated to libgit2 v0.25.1.
- Refactored code only useful to the LOOT application out of the API internals and into the application source code.

## 6.44.3 Removed

- `DatabaseInterface::GetPluginTags()`, `DatabaseInterface::GetPluginMessages()` and `DatabaseInterface::GetPluginCleanliness()` have been removed as they have been superseded by `DatabaseInterface::GetPluginMetadata()`.
- The `GameDetectionError` class, as it is no longer thrown by the API.
- The `PluginTags` struct, as it is no longer used.
- The `LanguageCode` enum, as the API now uses ISO language codes directly instead.
- The `PluginCleanliness` enum, as it's no longer used. Plugin cleanliness should now be checked by getting a plugin's evaluated metadata and checking if any dirty info is present. If none is present, the cleanliness is unknown. If dirty info is present, check if any of the English info strings contain the text "Do not clean": if not, the plugin is dirty.
- The LOOT API no longer caches the load order, as this is already done more accurately by `libloadorder` (which is used internally).

#### 6.44.4 Fixed

- Libgit2 error details were not being logged.
- A `FileAccessError` was thrown when the masterlist path was an empty string. The API now just skips trying to load the masterlist in this case.
- Updating the masterlist did not update the cached metadata, requiring a call to `LoadLists`.
- The reference documentation was broken due to an incompatibility between Sphinx 1.5.x and Breathe 4.4.

### 6.45 0.10.3 - 2017-01-08

#### 6.45.1 Added

- Automated 64-bit API builds.

#### 6.45.2 Changed

- Replaced `std::invalid_argument` exceptions thrown during condition evaluation with `ConditionSyntaxError` exceptions.
- Improved robustness of error handling when calculating file CRCs.

#### 6.45.3 Fixed

- Documentation was not generated correctly for enums, exceptions and structs exposed by the API.
- Added missing documentation for `CyclicInteractionError` methods.

### 6.46 0.10.2 - 2016-12-03

#### 6.46.1 Changed

- Updated libgit2 to 0.24.3.

#### 6.46.2 Fixed

- A crash could occur if some plugins that are hardcoded to always load were missing. Fixed by updating to libloadorder v9.5.4.
- Plugin cleaning metadata with no `info` value generated a warning message with no text.

## 6.47 0.10.1 - 2016-11-12

No API changes.

## 6.48 0.10.0 - 2016-11-06

### 6.48.1 Added

- Support for TES V: Skyrim Special Edition.

### 6.48.2 Changed

- Completely rewrote the API as a C++ API. The C API has been reimplemented as a wrapper around the C++ API, and can be found in a [separate repository](#).
- Windows builds now have a runtime dependency on the MSVC 2015 runtime redistributable.
- Rewrote the API documentation, which is now hosted online at [Read The Docs](#).
- The Windows release archive includes the `.lib` file for compile-time linking.
- LOOT now supports v0.10 of the metadata syntax. This breaks compatibility with existing syntax. See [the syntax version history](#) for the details.
- Updated libgit2 to 0.24.2.

### 6.48.3 Removed

- The `loot_get_tag_map()` function has no equivalent in the new C++ API as it is obsolete.
- The `loot_apply_load_order()` function has no equivalent in the new C++ API as it just passed through to `libloadorder`, which clients can use directly instead.

### 6.48.4 Fixed

- Database creation was failing when passing paths to symlinks that point to the game and/or game local paths.
- Cached plugin CRCs causing checksum conditions to always evaluate to false.
- Updating the masterlist when the user's `TEMP` and `TMP` environmental variables point to a different drive than the one LOOT is installed on.

## 6.49 0.9.2 - 2016-08-03

### 6.49.1 Changed

- `libespm` (2.5.5) and `Pseudosem` (1.1.0) dependencies have been updated to the versions given in brackets.

### 6.49.2 Fixed

- The packaging script used to create API archives was packaging the wrong binary, which caused the v0.9.0 and v0.9.1 API releases to actually be re-releases of a snapshot build made at some point between v0.8.1 and v0.9.0: the affected API releases were taken offline once this was discovered.
- `loot_get_plugin_tags()` remembering results and including them in the results of subsequent calls.
- An error occurred when the user's temporary files directory didn't exist and updating the masterlist tried to create a directory there.
- Errors when reading some Oblivion plugins during sorting, including the official DLC.

## 6.50 0.9.1 - 2016-06-23

No API changes.

## 6.51 0.9.0 - 2016-05-21

### 6.51.1 Changed

- Moved API header location to the more standard `include/loot/api.h`.
- Documented LOOT's masterlist versioning system.
- Made all API outputs fully const to make it clear they should not be modified and to avoid internal const casting.
- The `loot_db` type is now an opaque struct, and functions that used to take it as a value now take a pointer to it.

### 6.51.2 Removed

- The `loot_cleanup()` function, as the one string it used to destroy is now stored on the stack and so destroyed when the API is unloaded.
- The `loot_lang_any` constant. The `loot_lang_english` constant should be used instead.

## 6.52 0.8.1 - 2015-09-27

### 6.52.1 Changed

- Safety checks are now performed on file paths when parsing conditions (paths must not reference a location outside the game folder).
- Updated Boost (1.59.0), libgit2 (0.23.2) and CEF (branch 2454) dependencies.

### 6.52.2 Fixed

- A crash when loading plugins due to lack of thread safety.
- The masterlist updater and validator not checking for valid condition and regex syntax.
- The masterlist updater not working correctly on Windows Vista.

## 6.53 0.8.0 - 2015-07-22

### 6.53.1 Added

- Support for metadata syntax v0.8.

### 6.53.2 Changed

- Improved plugin loading performance for computers with weaker multithreading capabilities (eg. non-hyperthreaded dual-core or single-core CPUs).
- LOOT no longer outputs validity warnings for inactive plugins.
- Updated libgit2 to v0.23.0.

### 6.53.3 Fixed

- Many miscellaneous bugs, including initialisation crashes and incorrect metadata input/output handling.
- LOOT silently discarding some non-unique metadata: an error will now occur when loading or attempting to apply such metadata.
- LOOT's version comparison behaviour for a wide variety of version string formats.

## 6.54 0.7.1 - 2015-06-22

### 6.54.1 Fixed

- “No existing load order position” errors when sorting.
- Output of Bash Tag removal suggestions in `loot_write_minimal_list()`.

## 6.55 0.7.0 - 2015-05-20

Initial API release.

## INTRODUCTION

The metadata syntax is what LOOT's masterlists and userlists are written in. If you know YAML, good news: the syntax is essentially just YAML 1.2. If you don't know YAML, then its [Wikipedia page](#) is a good introduction. All you really need to know is:

- How lists and associative arrays (key-value maps) are written.
- That whitespace is important, and that only normal spaces (ie. no non-breaking spaces or tabs) count as such.
- That data entries that are siblings must be indented by the same amount, and child data nodes must be indented further than their parents (see the example later in this document if you don't understand).
- That YAML files must be written in a Unicode encoding.
- That each key in a key-value map must only appear once per map object.

An important point that is more specific to how LOOT uses YAML:

- Strings are case-sensitive, apart from file paths, regular expressions and checksums.
- File paths are evaluated relative to the game's Data folder.
- File paths cannot reference a path outside of the game's folder structure, ie. they cannot contain the substring `../..`.

In this document, where a value's type is given as **X list** this is equivalent to a YAML sequence of values which are of the data type **X**. Where a value's type is given as **X set**, this is equivalent to a YAML sequence of **unique** values which are of the data type **X**. Uniqueness is determined using the equality criteria for that data type. All the non-standard data types that LOOT's metadata syntax uses have their equality criteria defined later in this document.

Some strings are interpreted as **CommonMark**: where this is the case, the strings are interpreted according to version 0.29 of the specification.

## METADATA FILE STRUCTURE

The root of a metadata file is a key-value map. LOOT will recognise the following keys, none of which are required. Other keys may also be present, but are not processed by LOOT.

### **prelude**

The prelude can have any value, but if a masterlist prelude path is provided when loading metadata, the masterlist's **prelude** value will be replaced by the parsed content of the masterlist prelude file. The prelude exists so that metadata that is common across different masterlists can be shared without duplication.

Note that prelude replacement is only supported when using YAML's block style and an unquoted **prelude** key that is not preceded by a mapping key indicator and that is immediately followed by a colon separator, i.e. **prelude:.**

### **bash\_tags**

string list

A list of Bash Tags that are supported by the game. These Bash Tags are used to provide autocomplete suggestions in LOOT's metadata editor.

### **globals**

message list

A list of message data structures for messages that are displayed independently of any plugin.

### **groups**

group set

A set of group data structures that represent the groups that plugins can belong to.

### **plugins**

plugin list *and* plugin set

The plugin data structures that hold all the plugin metadata within the file. It is a mixture of a list and a set because **no non-regex plugin value may be equal to any other non-regex plugin value**, but there may be any number of equal regex plugin values, and non-regex plugin values may be equal to regex plugin values. If multiple plugin values match a single plugin, their metadata is merged in the order the values are listed, and as defined in *Merging Behaviour*.

The message and plugin data structures are detailed in the next section.

## 8.1 Example

```
prelude:
- &thanksForUsing
  type: say
  content: 'Thanks for using LOOT!'
  condition: 'file("LOOT")'

bash_tags:
- 'C.Climate'
- 'Relev'

globals:
- *thanksForUsing

groups:
- name: 'Map Markers'
  after:
  - 'default'

plugins:
- name: 'Armamentarium.esm'
  tag:
  - Relev
- name: 'ArmamentariumFran.esm'
  tag:
  - Relev
- name: 'Beautiful People 2ch-Ed.esm'
  tag:
  - Eyes
  - Graphics
  - Hair
  - R.Relations
- name: 'More Map Markers.esp'
  group: 'Map Markers'
```

## DATA STRUCTURES

LOOT expects metadata to be laid out using a certain set of data structures, described in this section.

### 9.1 Tag

LOOT metadata files can contain suggestions for the addition or removal of Bash Tags, and this is the structure used for them. It has two forms: a key-value string map and a scalar string.

#### 9.1.1 Map Form

**name**

**Required.** A Bash Tag, prefixed with a minus sign if it is suggested for removal.

**condition**

A condition string that is evaluated to determine whether this Bash Tag should be suggested: if it evaluates to true, the Tag is suggested, otherwise it is ignored. See *Condition Strings* for details. If undefined, defaults to an empty string.

#### 9.1.2 Scalar Form

The scalar form is simply the value of the map form's **name** key. Using the scalar form is equivalent to using the map form with an undefined **condition** key.

#### 9.1.3 Equality

Two tag data structures are equal if all their fields are equal. String equality is case-sensitive.

#### 9.1.4 Examples

Scalar form:

```
Relations
```

Map form:

```
name: -Relations
condition: 'file("Mart"'s Monster Mod for 000.esm") or file("FCOM_Convergence.esm")'
```

## 9.2 File

This structure can be used to hold file paths. It has two forms: a key-value string map and a scalar string.

### 9.2.1 Map Form

**name**

**Required.** An exact (ie. not regex) file path or name.

**display**

A CommonMark string, to be displayed instead of the file path in any generated messages, eg. the name of the mod the file belongs to.

**detail**

string or localised content list

if this file causes an error message to be displayed (e.g. because it's a missing requirement), this detail message content will be appended to that error message. If a string is provided, it will be interpreted as CommonMark. If a localised content list is provided, one of the structures must be for English. If undefined, defaults to an empty string.

**condition**

A condition string that is evaluated to determine whether this file data should be used: if it evaluates to true, the data is used, otherwise it is ignored. See *Condition Strings* for details.

### 9.2.2 Scalar Form

The scalar form is simply the value of the map form's `name` key. Using the scalar form is equivalent to using the map form with undefined `display` and `condition` keys.

### 9.2.3 Equality

Two file data structures are equal if all their fields are equal. `name` field equality is case-insensitive, the other fields use case-sensitive equality.

### 9.2.4 Examples

Scalar form:

```
'../obse_loader.exe'
```

Map form:

```
name: '../obse_loader.exe'
condition: 'version("../obse_loader.exe", "0.0.18.0", >=) '
display: 'OBSE v18+'
```

## 9.3 Group

Groups represent sets of plugins, and are a way to concisely and extensibly load sets of plugins after other sets of plugins.

This structure can be used to hold group definitions. It is a key-value map.

**name**

string

**Required.** A case-sensitive name that identifies the group.

**description**

string

A CommonMark description of the group, e.g. what sort of plugins it contains. If undefined, the description is an empty string.

**after**

string set

The names of groups that this group loads after. Group names are case-sensitive. If undefined, the set is empty. The named groups must be defined when LOOT sorts plugins, but they don't need to be defined in the same metadata file.

Sorting errors will occur if:

- A group loads after another group that does not exist.
- Group loading is cyclic (e.g. A loads after B and B loads after A).

### 9.3.1 Merging Groups

When a group definition for an already-defined group is encountered, the `description` field is replaced if the new value is not an empty string, and the `after` sets of the two definitions are merged.

### 9.3.2 The default Group

There is one predefined group named `default` that all plugins belong to by default. It is defined with an empty `after` set, as no other predefined groups exist for it to load after.

Like any other group, the `default` group can be redefined to add group names to its `after` set.

### 9.3.3 Equality

Two group data structures are equal if the values of their `name` keys are identical.

### 9.3.4 Examples

```
# Create a group for map marker plugins that loads after the predefined
# 'default' group.
name: 'Map Markers'
description: 'A group for map marker plugins that need to load late.'
after:
  - 'default'
```

```
# Extend the predefined 'default' group to load after an 'Unofficial Patches'
# group that is defined elsewhere.
name: 'default'
after:
  - 'Unofficial Patches'
```

## 9.4 Localised Content

The localised content data structure is a key-value string map.

#### text

**Required.** The CommonMark message content string.

#### lang

**Required.** The language that `text` is written in, given as a code of the form `ll` or `ll_CC`, where `ll` is an ISO 639-1 language code and `CC` is an ISO 3166 country code. For example,

Language	Code
Bulgarian	bg
Chinese (Simplified)	zh_CN
Czech	cs
Danish	da
English	en
Finnish	fi
French	fr
German	de
Italian	it
Japanese	ja
Korean	ko
Polish	pl
Portuguese	pt_PT
Portuguese (Brazil)	pt_BR
Russian	ru
Spanish	es
Swedish	sv
Ukrainian	uk_UA

### 9.4.1 Equality

Two localised content data structures are equal if all their fields are equal. Field equality is case-sensitive.

## 9.5 Message

Messages are given as key-value maps.

#### type

string

**Required.** The type string can be one of three keywords.

#### say

A generic message, useful for miscellaneous notes.

#### warn

A warning message, describing a non-critical issue with the user's mods (eg. dirty mods).

#### error

An error message, describing a critical installation issue (eg. missing masters, corrupt plugins).

#### content

string or localised content list

**Required.** Either simply a CommonMark string, or a list of localised content data structures. If the latter, one of the structures must be for English.

#### condition

string

A condition string that is evaluated to determine whether the message should be displayed: if it evaluates to true, the message is displayed, otherwise it is not. See *Condition Strings* for details.

#### subs

string list

A list of CommonMark strings to be substituted into the message content string. The content string must use numbered specifiers (%1%, %2%, etc.), where the numbers correspond to the position of the substitution string in this list to use, to denote where these strings are to be substituted.

### 9.5.1 Language Support

If a message's **content** value is a string, the message will use the string as its content if displayed. Otherwise, the first localised content structure with a language or locale code that matches LOOT's current language will be used as the message's content if displayed. If there are no exact matches, LOOT will try to find a close match. If LOOT's current language uses a locale code, it will display the first structure with the same language code, but not another locale code with the same language code. For example, if LOOT's current language has locale code `pt_BR`, it will display the first structure with language code `pt` (but not locale code `pt_PT`) if none exist with locale code `pt_BR`. If LOOT's current language has a language code, it will display the first structure with a locale code that contains that language code. For example, if LOOT's current language has language code `pt`, it will display the first structure with locale code `pt_PT` or `pt_BR` if none exist with language code `pt`. If there are no exact or close matches, then the first structure in English will be used.

### 9.5.2 Equality

Two message data structures are equal if their *type*, *content* and *condition* fields are equal, after any *subs* values have been substituted into *content* strings. If the *content* field is a string, it is treated as a localised content list containing a single English-language string. String equality is case sensitive.

### 9.5.3 Examples

```
type: say
content:
- lang: en
  text: 'An example link: <http://www.example.com>'
- lang: zh_CN
  text: ': <http://www.example.com>'
condition: 'file("foo.esp")'
```

would be displayed as

- : <http://www.example.com>

if the current language was Simplified Chinese and `foo.esp` was installed, while

```
type: say
content: 'An alternative [example link](http://www.example.com), with no translations.'
```

would be displayed as

- An alternative [example link](http://www.example.com), with no translations.

In English,

```
type: say
content: 'A newer version of %1% [is available](%2%).'
subs:
- 'this plugin'
- 'http://www.example.com'
```

would be displayed as

- A newer version of this plugin is [available](http://www.example.com).

## 9.6 Location

This data structure is used to hold information on where a plugin is hosted online. It has two forms: a key-value string map and a scalar string.

### 9.6.1 Map Form

#### link

**Required.** A URL at which the plugin is found.

#### name

A descriptive name for the URL, which may be used as hyperlink text. If undefined, defaults to an empty string.

### 9.6.2 Scalar Form

The scalar form is simply the value of the map form's `link` key. Using the scalar form is equivalent to using the map form with an undefined `name` key.

### 9.6.3 Equality

Two location data structures are equal if all their fields are equal. Field equality is case-sensitive.

### 9.6.4 Examples

Scalar form:

```
'https://www.nexusmods.com/skyrim/mods/71214'
```

Map form:

```
link: 'https://www.nexusmods.com/skyrim/mods/71214'
name: 'USLEEP on Skyrim Nexus'
```

## 9.7 Cleaning Data

This structure holds information on which versions of a plugin are dirty or clean, and if dirty, how many identical-to-master records, deleted records and deleted navmeshes (if applicable) it contains. Cleaning data is given as a key-value map.

#### crc

hexadecimal integer

**Required.** The CRC-32 checksum of the plugin. If the plugin is dirty, this needs to be the CRC of the plugin before before cleaning. LOOT displays the CRCs of installed plugins in its report. The 8-character CRC should be preceded by `0x` so that it is interpreted correctly.

#### util

string

**Required.** The utility that was used to check the plugin for dirty edits. If available, the version of the utility used should also be included (e.g. `TES5Edit v3.11`). The string will be interpreted as CommonMark.

#### detail

string or localised content list

A message that will be displayed to the user. If a string is provided, it will be interpreted as CommonMark. If a localised content list is provided, one of the structures must be for English. This is only used if the plugin is dirty, and is intended for providing cleaning instructions to the user. If undefined, defaults to an empty string.

**itm**

integer

The number of identical-to-master records reported for the dirty plugin. If undefined, defaults to zero.

**udr**

integer

The number of undeleted records reported for the dirty plugin. If undefined, defaults to zero.

**nav**

integer

The number of deleted navmeshes reported for the dirty plugin. If undefined, defaults to zero.

### 9.7.1 Equality

Two plugin cleaning data structures are equal if all their fields are equal. *util* field equality is case-sensitive. If the *detail* field is a string, it is treated as a localised content data structure.

### 9.7.2 Examples

A dirty plugin:

```
crc: 0x3DF62ABC
util: '[TES5Edit](http://www.nexusmods.com/skyrim/mods/25859) v3.1.1'
detail: 'A cleaning guide is available [here](http://www.creationkit.com/index.php?
↪title=TES5Edit_Cleaning_Guide_-_TES5Edit).'
itm: 4
udr: 160
```

A clean plugin:

```
crc: 0x2ABC3DF6
util: '[TES5Edit](http://www.nexusmods.com/skyrim/mods/25859) v3.1.1'
```

## 9.8 Plugin

This is the structure that brings all the others together, and forms the main component of a metadata file. It is a key-value map.

**name**

string

**Required.** Can be an exact plugin filename or a regular expression plugin filename. If the filename contains any of the characters `: \ * ? |`, the string will be treated as a regular expression, otherwise it will be treated as an exact filename. For example, `Example\ .esm` will be treated as a regular expression, as it contains a `\` character.

Regular expression plugin filenames must be written in [modified ECMAScript](#) syntax.

**group**

string

The name of the group the plugin belongs to. If unspecified, defaults to `default`.

The named group must exist when LOOT sorts plugins, but doesn't need to be defined in the same metadata file. If at sort time the group does not exist, a sorting error will occur.

The plugin must load after all the plugins in the groups its group is defined to load after, resolving them recursively. An exception exists if doing so would introduce a cyclic dependency between two plugins without any other group loading rules applied.

For example, if for plugins A.esp, B.esp, C.esp and D.esp:

- B.esp has A.esp as a master
- A.esp is in group A
- B.esp and C.esp are in the default group
- D.esp is in group D
- group A loads after the default group
- the default group loads after group D

Then the load order must be D.esp, C.esp, A.esp, B.esp. Although A.esp's group must load after B.esp's group, this would cause a cycle between A.esp and B.esp, so the requirement is ignored for that pair of plugins.

However, if for plugins A.esp, B.esp and C.esp in groups of the same names:

1. group B loads after group A
2. group C loads after group B
3. A.esp has C.esp as a master

This will cause a sorting error, as neither group rule introduces a cyclic dependency when combined in isolation with the third rule, but having all three rules applied causes a cycle.

#### **after**

file set

Plugins that this plugin must load after, but which are not dependencies. Used to resolve specific compatibility issues. If undefined, the set is empty.

**Note:** since an `after` entry uses a `file` structure, its `name` value can't be a regex. This applies to `req` & `inc` entries too.

#### **req**

file set

Files that this plugin requires to be present. This plugin will load after any plugins listed. If any of these files are missing, an error message will be displayed. Intended for use specifying implicit dependencies, as LOOT will detect a plugin's explicit masters itself. If undefined, the set is empty.

**Note:** if a `condition` is used in a `req` entry, a requirement message will only be displayed if the file isn't present *and* the `condition` is true.

#### **inc**

file set

Files that this plugin is incompatible with. If any of these files are present, an error message will be displayed. If undefined, the set is empty.

#### **msg**

message list

The messages attached to this plugin. The messages will be displayed in the order that they are listed. If undefined, the list is empty.

**tag**

tag set

Bash Tags suggested for this plugin. If a Bash Tag is suggested for both addition and removal, the latter will override the former when the list is evaluated. If undefined, the set is empty.

**url**

location set

An unordered set of locations for this plugin. If the same version can be found at multiple locations, only one location should be recorded. If undefined, the set is empty. This metadata is not currently used by LOOT.

**dirty**

cleaning data set

An unordered set of cleaning data structures for this plugin, identifying dirty plugins.

**clean**

cleaning data set

An unordered set of cleaning data structures for this plugin, identifying clean plugins. The `itm`, `udr` and `nav` fields are unused in this context, as they're assumed to be zero.

## 9.8.1 Equality

The equality of two plugin data structures is determined by comparing the values of their `name` keys.

- If neither or both values are regular expressions, then the plugin data structures are equal if the lowercased values are identical.
- If one value is a regular expression, then the plugin data structures are equal if the other value is an exact match for it.

## 9.8.2 Merging Behaviour

Key	Merge Behaviour (merging B into A)
name	Not merged.
group	Replaced by B's value only if A has no value set.
after	Merged. If B's file set contains an item that is equal to one already present in A's file set, B's item is discarded.
req	Merged. If B's file set contains an item that is equal to one already present in A's file set, B's item is discarded.
inc	Merged. If B's file set contains an item that is equal to one already present in A's file set, B's item is discarded.
msg	Merged. B's message list is appended to A's message list.
tag	Merged. If B's tag set contains an item that is equal to one already present in A's tag set, B's item is discarded.
url	Merged. If B's location set contains an item that is equal to one already present in A's location set, B's item is discarded.
dirty	Merged. If B's dirty data set contain an item that is equal to one already present in A's dirty data set, B's item is discarded.
clean	Merged. If B's clean data set contain an item that is equal to one already present in A's clean data set, B's item is discarded.

### 9.8.3 Examples

```

name: 'Oscuro's_Oblivion_Overhaul.esm'
req:
  - 'Oblivion.esm' # Don't do this, Oblivion.esm is a master of Oscuro's_Oblivion_
↪Overhaul.esm, so LOOT already knows it's required.
  - name: 'example.esp'
    display: '[Example Mod](http://www.example.com)'
    condition: 'version("Oscuro's_Oblivion_Overhaul.esm", "15.0", ==)'
tag:
  - Actors.Spells
  - Graphics
  - Invent
  - Relations
  - Scripts
  - Stats
  - name: -Relations
    condition: 'file("Mart's Monster Mod for 000.esm") or file("FCOM_Convergence.esm")'
msg:
  - type: say
    content: 'Do not clean. "Dirty" edits are intentional and required for the mod to_
↪function.'
```

## CONDITION STRINGS

Condition strings can be used to ensure that data is only acted on by LOOT under certain circumstances. They are very similar to boolean conditional expressions in programming languages such as Python, though more limited.

Omitting optional parentheses (see below), their [EBNF](#) grammar is:

```
expression      ::= condition, { logical_or, compound_condition }
compound_condition ::= condition, { logical_and, condition }
condition       ::= ( [ logical_not ], function ) | ( [ logical_not ], "(", expression, ")" )
logical_and     ::= "and"
logical_or      ::= "or"
logical_not     ::= "not"
```

### 10.1 Types

#### **filesystem\_path**

A double-quoted filesystem path, or "LOOT", which resolves to *LOOT.exe* in the current working directory. Bear in mind that *LOOT.exe* may not be present if the condition is being evaluated by an application other than LOOT.

#### **file\_path**

A double-quoted file path, or "LOOT", which resolves to *LOOT.exe* in the current working directory. Bear in mind that *LOOT.exe* may not be present if the condition is being evaluated by an application other than LOOT.

#### **regular\_expression**

A double-quoted file path, with a regular expression in place of a filename. The path must use / for directory separators, not \. The regular expression must be written in a [modified Perl](#) syntax.

Only the filename path component will be evaluated as a regular expression. For example, given the regex file path `Meshes/Resources(1|2)/(upperclass)?table.nif`, LOOT will look for a file named `table.nif` or `upperclasstable.nif` in the `Meshes\Resources(1|2)` folder, rather than looking in the `Meshes\Resources1` and `Meshes\Resources2` folders.

#### **checksum**

A string of hexadecimal digits representing an unsigned integer that is the data checksum of a file. LOOT displays the checksums of plugins in its user interface after running.

#### **version**

A double-quoted string of characters representing the version of a plugin or executable. LOOT displays the versions of plugins in its user interface after running.

#### **comparison\_operator**

One of the following comparison operators.

<code>==</code>	Is equal to
<code>!=</code>	Is not equal to
<code>&lt;</code>	Is less than
<code>&gt;</code>	Is greater than
<code>&lt;=</code>	Is less than or equal to
<code>&gt;=</code>	Is greater than or equal to

## 10.2 Functions

There are several conditions that can be tested for using the functions detailed below. All functions return a boolean. For functions that take a path or regex, the argument is treated as regex if it contains any of the characters `: \*?|`.

### **file(filesystem\_path path)**

Returns true if path is installed, and false otherwise.

### **file(regular\_expression regex)**

Returns true if a file matching regex is found, and false otherwise.

### **readable(filesystem\_path path)**

Returns true if path is a readable directory or file, and false otherwise.

This is particularly useful when writing conditions for games that are available from the Microsoft Store and/or Xbox app, as games installed using them have executables that have heavily restricted permissions, and attempts to read them result in permission denied errors. You can use this function to guard against such errors by calling it before the `checksum`, `version` or `product_version` functions.

### **active(file\_path path)**

Returns true if path is an active plugin, and false otherwise.

### **active(regular\_expression regex)**

Returns true if an active plugin matching regex is found, and false otherwise.

### **many(regular\_expression regex)**

Returns true if more than one file matching regex is found, and false otherwise.

### **many\_active(regular\_expression regex)**

Returns true if more than one active plugin matching regex is found, and false otherwise.

### **is\_master(file\_path path)**

Returns true if path is an installed master plugin, and false otherwise.

### **checksum(file\_path path, checksum expected\_checksum)**

Returns true if the calculated CRC-32 checksum of path matches expected\_checksum, and false otherwise.  
Returns false if path does not exist.

### **version(file\_path path, version given\_version, comparison\_operator comparator)**

Returns true if the boolean expression:

```
actual_version comparator given_version
```

(where `actual version` is the version read from `path`) holds true, and false otherwise.

- If `path` is a plugin, its version is read from its description field.
- If `path` is not a plugin, it will be assumed to be an executable (e.g. `*.exe` or `*.dll`), and its version is read from its File Version field.
- If `path` does not exist or does not have a version number, the condition evaluates to true for the `!=`, `<` and `<=` comparators, i.e. a missing version is always less than the given version.
- If `path` is not readable or is not a plugin or an executable, an error will occur.

The supported version syntax and precedence rules are detailed in the section below.

**product\_version(file\_path path, version given\_version, comparison\_operator comparator)**

Returns true if the boolean expression:

```
actual_version comparator given_version
```

(where `actual version` is the version read from `path`) holds true, and false otherwise. `path` must be an executable (e.g. `*.exe` or `*.dll`), and its version is read from its Product Version field.

- If `path` does not exist or does not have a version number, the condition evaluates to true for the `!=`, `<` and `<=` comparators, i.e. a missing version is always less than the given version.
- If `path` is not a readable executable, an error will occur.

The supported version syntax and precedence rules are detailed in the section below.

### 10.2.1 Version Syntax & Comparison Rules

Version parsing and comparison is compatible with [Semantic Versioning](#), with the following exceptions:

- Pre-release identifiers may not include hyphens (`-`), as they are treated as separators. For example, a SemVer-compliant parser would treat `1.0.0-alpha.1.x-y-z.--` as `([1, 0, 0], ["alpha", 1, "x-y-z", "--"])` but libloot treats it as `([1, 0, 0], ["alpha", 1, "x", "y", "z", "", ""])`.
- Identifiers that contain non-digit characters are lowercased before being compared lexically, so that their comparison is case-insensitive instead of case-sensitive. For example, SemVer specifies that `1.0.0-alpha` is greater than `1.0.0-Beta`, but libloot compares them with the opposite result.

These exceptions are necessary to support an extended range of real-world versions that do not conform to SemVer. The supported extensions are:

- Leading zeroes are allowed and ignored in major, minor and patch version numbers and numeric pre-release IDs. For example, `01.02.03` and `1.2.3` are equal.
- An arbitrary number of version numbers is allowed. To support this, the major, minor and patch version numbers are treated as a sequence of numeric release IDs, and any subsequent version numbers are just additional release IDs that get appended to the sequence. For example, `1.2.3` may be represented as the sequence `[1, 2, 3]`, and `1.2.3.4` would be represented as `[1, 2, 3, 4]`.

If two versions with a different number of release identifiers are compared, the version with fewer release identifiers is padded with zero values until they are the same length. Each release identifier in one version is then compared against the release identifier in the same position in the other version. For example, `1-beta` is padded to `1.0.0-beta` before being compared against `1.0.1-beta`, and the result is that `1.0.1-beta` is greater than `1-beta`.

- Release IDs may be separated by a period (`.`) or a comma (`,`). For example, `1.2.3.4` and `1,2,3,4` are equal.

- The separator between release IDs and pre-release IDs may be a hyphen (-), a space (" "), a colon (:) or an underscore (\_). For example, 1.2.3-alpha, 1.2.3 alpha, 1.2.3:alpha and 1.2.3\_alpha are all equal.
- Pre-release IDs may be separated by a period (.), a hyphen (-), a space (" "), a colon (:) or an underscore (\_). For example, 1.2.3-alpha.1, 1.2.3-alpha-1, 1.2.3-alpha 1, 1.2.3-alpha:1 and 1.2.3-alpha\_1 are all equal.
- Non-numeric release IDs are allowed. A non-numeric release ID may contain any character (not just ASCII characters) that is not one of the separators listed above or a plus sign (+). For example, 0.78b.1 is allowed.

Non-numeric release IDs use the same comparison rules as non-numeric pre-release IDs, with the exception that a non-numeric release ID is not always greater than a numeric release ID:

- If the non-numeric release ID has no leading digits, it is greater than the numeric release ID. For example, 1.A is greater than 1.1.
- If the non-numeric release ID has leading digits, they are parsed as a number, and this is compared against the numeric release ID:
  - \* If the two numbers are equal then the non-numeric release ID is greater than the numeric release ID. For example, 1.1A is greater than 1.1.
  - \* Otherwise, the result of comparing the two numbers is used as the result of comparing the two release IDs. For example, 1.2 is greater than 1.1A and 1.1A is greater than 1.0.
- Pre-release IDs may contain any character (not just ASCII characters) that is not one of the pre-release ID separators listed above or a plus sign (+).
- Before non-numeric IDs (release or pre-release) are compared, they are lowercased according to Unicode's lowercasing rules.
- As a special case, version strings that are four comma-and-space-separated sequences of digits are interpreted as if the comma-and-space separators were periods (.). For example, 0, 2, 0, 12 and 0.2.0.12 are equal.

## 10.3 Logical Operators

The and, or and not operators have their usual definitions.

### 10.3.1 Order of Evaluation

Condition strings are evaluated according to the usual C-style operator precedence rules, and parentheses can be used to override these rules. For example:

```
function and function or not function
```

is evaluated as:

```
( function and function ) or ( not function )
```

but:

```
function and ( function or not function )
```

is evaluated as:

```
function and ( function or ( not function ) )
```

## 10.4 Performance

LOOT caches the results of condition evaluations. A regular expression check will still take longer than a file check though, so use the former only when appropriate to do so.

## VERSION HISTORY

The version history of the metadata syntax is given below.

### 11.1 0.18 - 2022-02-27

#### 11.1.1 Added

- The condition function `readable(filesystem_path path)`, which checks if the given path is a readable directory or file.

#### 11.1.2 Changed

- The documentation for the version comparison condition functions has been updated to detail the supported version syntax and semantics.
- Mentions of GitHub Flavored Markdown have been replaced with CommonMark, as LOOT now uses the latter instead of the former.

#### 11.1.3 Fixed

- Support for `not (<expression>)` syntax was not properly documented.
- The documentation for the version comparison functions stated that missing versions would be treated as if they were `0`, which was not accurate.

### 11.2 0.17 - 2021-09-24

#### 11.2.1 Added

- The File data structure now has a `detail` key that takes a string or localised content list.
- The top-level `prelude` key can be used to supply common data structure definitions, and in masterlists its value is replaced by the contents of the masterlist prelude file, if present.
- Support for parsing inverted metadata conditions (`not (<expression>)`).

### 11.2.2 Changed

- The cleaning data structure's `info` key has been renamed to `detail` for consistency.

## 11.3 0.16 - 2020-07-12

### 11.3.1 Changed

- Equality for all metadata data structures is now determined by comparison of all their fields. String comparison is case-sensitive, with the exception of `File`'s `name` field.

### 11.3.2 Removed

- The `enabled` field has been removed from plugin metadata objects.

## 11.4 0.15 - 2019-11-05

### 11.4.1 Added

- The condition function `is_master(file_path path)`, which checks if the given file is an installed master plugin.

## 11.5 0.14 - 2018-12-09

### 11.5.1 Added

- The `Group` data structure now has a `description` key that takes a string value.
- The condition function `product_version(file_path path, version given_version, comparison_operator comparator)`, which checks against the `Product Version` field of an executable.

### 11.5.2 Changed

- `clean` and `dirty` metadata are now allowed in regex plugin entries.
- `Location`, `Message`, `MessageContent` and `Tag` equality comparisons are now case-sensitive.
- Regular expressions in condition strings now use a [modified Perl grammar](#) instead of a modified ECMAScript grammar. Plugin object name fields still use the modified ECMAScript grammar for regex values. To improve portability and avoid mistakes, it's best to stick to using the subset of regular expression features that are common to both grammars.

### 11.5.3 Removed

- The change in regular expression grammar means that the following regular expression features are no longer supported in condition strings:
  - `\c<letter>` control code escape sequences, use `\x<hex>` instead
  - The `\0` null escape sequence, - use `\x00` instead
  - The `[:d:]`, `[:w:]` and `[:s:]` character classes, use `[:digit:]`, `[:alnum:]` and `[:space:]` instead respectively.
  - `\<number>` backreferences
  - `(?=<subpattern>)` and `(?!<subpattern>)` positive and negative lookahead

## 11.6 0.13 - 2018-04-02

### 11.6.1 Added

- The Group data structure.
- The groups list to the root of the metadata file format.
- The group key to the plugin data structure.

### 11.6.2 Removed

- The priority field from the plugin data structure.
- The `global_priority` field from the plugin data structure.

## 11.7 0.10 - 2016-11-06

### 11.7.1 Added

- The clean key to the plugin data structure.
- The `global_priority` field to the plugin data structure.
- The `many_active()` condition function.
- The info key to the cleaning data structure.

### 11.7.2 Changed

- Renamed the `str` key in the localised content data structure to `text`.
- The `priority` field of the plugin data structure now stores values between -127 and 127 inclusive.
- Regular expressions no longer accept `\` as a directory separator: `/` must now be used.
- The `file()` condition function now also accepts a regular expression.
- The `active()` condition function to also accept a regular expression.

- Renamed the dirty info data structure to the cleaning data structure.

### 11.7.3 Removed

- The `regex()` condition function, as it has been obsoleted by the `file()` function's new regex support.

## 11.8 0.8 - 2015-07-22

### 11.8.1 Added

- The `name` key to the location data structure.
- The `many("regex")` condition function.
- The documentation now defines the equality criteria for all of the metadata syntax's non-standard data structures.

### 11.8.2 Changed

- Detection of regular expression plugin entries. Previously, a plugin entry was treated as having a regular expression filename if the filename ended with `\.esp` or `\.esp` . Now, a plugin entry is treated as having a regular expression filename if the filename contains one or more of `:\*?|` .

### 11.8.3 Removed

- Removed the `ver` key in the location data structure.

### 11.8.4 Fixed

- The documentation gave the values of the `after` , `req` , `inc` , `tag` , `url` and `dirty` keys as lists, when they have always been sets.

## 11.9 0.7 - 2015-05-20

### 11.9.1 Added

- The message string substitution key, i.e. `sub` , in the message data structure.
- Support for YAML merge keys, i.e. `<<` .

### 11.9.2 Changed

- Messages may now be formatted using most of GitHub Flavored Markdown, minus the GitHub-specific features (like @mentions, issue/repo linking and emoji).

## 11.10 0.6 - 2014-07-05

No changes.

## 11.11 0.5 - 2014-03-31

Initial release.

## COPYRIGHT NOTICE

LOOT and its API are distributed under the GNU General Public License v3.0. The documentation is distributed under the GNU Free Documentation License v1.3. The full texts of both licenses are included in *Copyright License Texts*.

While the GPL license allows anyone to make derivative works of LOOT, the LOOT Team encourages those thinking of doing so to first discuss their reasoning for such an endeavour with the Team. It may be that what the derivative work would do differently is already planned for a future version of LOOT or would be happily integrated into LOOT, thus avoiding any extra effort by others.

LOOT has been specifically designed to prevent it being locked into the LOOT Team's official masterlist repositories. Nevertheless, the LOOT Team appeals to the community to avoid the distribution of unofficial masterlists, as this would only hamper the effort to create one set of stores for load order information. Any issues with a masterlist are best brought to the attention of the LOOT Team so that they may be remedied.

## 13.1 Boost

Boost Software License - Version 1.0 - August 17th, 2003

Permission **is** hereby granted, free of charge, to **any** person **or** organization obtaining a copy of the software **and** accompanying documentation covered by this license (the "**Software**") to use, reproduce, display, distribute, execute, **and** transmit the Software, **and** to prepare derivative works of the Software, **and** to permit third-parties to whom the Software **is** furnished to do so, **all** subject to the following:

The copyright notices **in** the Software **and** this entire statement, including the above license grant, this restriction **and** the following disclaimer, must be included **in all** copies of the Software, **in** whole **or in** part, **and all** derivative works of the Software, unless such copies **or** derivative works are solely **in** the form of machine-executable **object** code generated by a source language processor.

THE SOFTWARE IS PROVIDED "**AS IS**", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE AND NON-INFRINGEMENT. IN NO EVENT SHALL THE COPYRIGHT HOLDERS OR ANYONE DISTRIBUTING THE SOFTWARE BE LIABLE FOR ANY DAMAGES OR OTHER LIABILITY, WHETHER IN CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

## 13.2 libloot, esplugin & Libloadorder

### GNU GENERAL PUBLIC LICENSE Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <<http://fsf.org/>>  
Everyone **is** permitted to copy **and** distribute verbatim copies  
of this license document, but changing it **is not** allowed.

#### Preamble

The GNU General Public License **is** a free, copyleft license **for**  
software **and** other kinds of works.

The licenses **for** most software **and** other practical works are designed  
to take away your freedom to share **and** change the works. By contrast,  
the GNU General Public License **is** intended to guarantee your freedom to  
share **and** change **all** versions of a program--to make sure it remains free  
software **for** **all** its users. We, the Free Software Foundation, use the  
GNU General Public License **for** most of our software; it applies also to  
**any** other work released this way by its authors. You can apply it to  
your programs, too.

When we speak of free software, we are referring to freedom, **not**  
price. Our General Public Licenses are designed to make sure that you  
have the freedom to distribute copies of free software (**and** charge **for**  
them **if** you wish), that you receive source code **or** can get it **if** you  
want it, that you can change the software **or** use pieces of it **in** new  
free programs, **and** that you know you can do these things.

To protect your rights, we need to prevent others **from denying** you  
these rights **or** asking you to surrender the rights. Therefore, you have  
certain responsibilities **if** you distribute copies of the software, **or if**  
you modify it: responsibilities to respect the freedom of others.

For example, **if** you distribute copies of such a program, whether  
gratis **or for** a fee, you must **pass** on to the recipients the same  
freedoms that you received. You must make sure that they, too, receive  
**or** can get the source code. And you must show them these terms so they  
know their rights.

Developers that use the GNU GPL protect your rights **with** two steps:  
(1) **assert** copyright on the software, **and** (2) offer you this License  
giving you legal permission to copy, distribute **and/or** modify it.

For the developers' **and authors'** protection, the GPL clearly explains  
that there **is** no warranty **for** this free software. For both users' **and**  
authors' **sake**, the GPL **requires that modified versions be marked as**  
changed, so that their problems will **not** be attributed erroneously to

(continues on next page)

(continued from previous page)

authors of previous versions.

Some devices are designed to deny users access to install **or** run modified versions of the software inside them, although the manufacturer can do so. This **is** fundamentally incompatible **with** the aim of protecting users' **freedom to change the software**. The systematic pattern of such abuse occurs **in** the area of products **for** individuals to use, which **is** precisely where it **is** most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice **for** those products. If such problems arise substantially **in** other domains, we stand ready to extend this provision to those domains **in** future versions of the GPL, **as** needed to protect the freedom of users.

Finally, every program **is** threatened constantly by software patents. States should **not** allow patents to restrict development **and** use of software on general-purpose computers, but **in** those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms **and** conditions **for** copying, distribution **and** modification follow.

## TERMS AND CONDITIONS

### 0. Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such **as** semiconductor masks.

"The Program" refers to **any** copyrightable work licensed under this License. Each licensee **is** addressed **as** "you". "Licensees" **and** "recipients" may be individuals **or** organizations.

To "modify" a work means to copy **from or** adapt **all or** part of the work **in** a fashion requiring copyright permission, other than the making of an exact copy. The resulting work **is** called a "modified version" of the earlier work **or** a work "based on" the earlier work.

A "covered work" means either the unmodified Program **or** a work based on the Program.

To "propagate" a work means to do anything **with** it that, without permission, would make you directly **or** secondarily liable **for** infringement under applicable copyright law, **except** executing it on a computer **or** modifying a private copy. Propagation includes copying, distribution (**with or** without modification), making available to the public, **and in** some countries other activities **as** well.

To "convey" a work means **any** kind of propagation that enables other

(continues on next page)

(continued from previous page)

parties to make **or** receive copies. Mere interaction **with** a user through a computer network, **with** no transfer of a copy, **is not** conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient **and** prominently visible feature that (1) displays an appropriate copyright notice, **and** (2) tells the user that there **is** no warranty **for** the work (**except** to the extent that warranties are provided), that licensees may convey the work under this License, **and** how to view a copy of this License. If the interface presents a **list** of user commands **or** options, such **as** a menu, a prominent item **in** the **list** meets this criterion.

#### 1. Source Code.

The "source code" **for** a work means the preferred form of the work **for** making modifications to it. "Object code" means **any** non-source form of a work.

A "Standard Interface" means an interface that either **is** an official standard defined by a recognized standards body, **or**, **in** the case of interfaces specified **for** a particular programming language, one that **is** widely used among developers working **in** that language.

The "System Libraries" of an executable work include anything, other than the work **as** a whole, that (a) **is** included **in** the normal form of packaging a Major Component, but which **is not** part of that Major Component, **and** (b) serves only to enable use of the work **with** that Major Component, **or** to implement a Standard Interface **for** which an implementation **is** available to the public **in** source code form. A "Major Component", **in** this context, means a major essential component (kernel, window system, **and** so on) of the specific operating system (**if any**) on which the executable work runs, **or** a compiler used to produce the work, **or** an **object** code interpreter used to run it.

The "Corresponding Source" **for** a work **in object** code form means **all** the source code needed to generate, install, **and** (**for** an executable work) run the **object** code **and** to modify the work, including scripts to control those activities. However, it does **not** include the work's System Libraries, **or** general-purpose tools **or** generally available free programs which are used unmodified **in** performing those activities but which are **not** part of the work. For example, Corresponding Source includes interface definition files associated **with** source files **for** the work, **and** the source code **for** shared libraries **and** dynamically linked subprograms that the work **is** specifically designed to require, such **as** by intimate data communication **or** control flow between those subprograms **and** other parts of the work.

The Corresponding Source need **not** include anything that users can regenerate automatically **from other** parts of the Corresponding Source.

The Corresponding Source **for** a work **in** source code form **is** that

(continues on next page)

(continued from previous page)

same work.

## 2. Basic Permissions.

All rights granted under this License are granted **for** the term of copyright on the Program, **and** are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output **from running** a covered work **is** covered by this License only **if** the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use **or** other equivalent, **as** provided by copyright law.

You may make, run **and** propagate covered works that you do **not** convey, without conditions so long **as** your license otherwise remains **in** force. You may convey covered works to others **for** the sole purpose of having them make modifications exclusively **for** you, **or** provide you **with** facilities **for** running those works, provided that you comply **with** the terms of this License **in** conveying **all** material **for** which you do **not** control copyright. Those thus making **or** running the covered works **for** you must do so exclusively on your behalf, under your direction **and** control, on terms that prohibit them **from making** any copies of your copyrighted material outside their relationship **with** you.

Conveying under **any** other circumstances **is** permitted solely under the conditions stated below. Sublicensing **is not** allowed; section 10 makes it unnecessary.

## 3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under **any** applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, **or** similar laws prohibiting **or** restricting circumvention of such measures.

When you convey a covered work, you waive **any** legal power to forbid circumvention of technological measures to the extent such circumvention **is** effected by exercising rights under this License **with** respect to the covered work, **and** you disclaim **any** intention to limit operation **or** modification of the work **as** a means of enforcing, against the work's users, your **or** third parties' **legal rights to forbid circumvention of** technological measures.

## 4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's **source code** as you receive it, **in any** medium, provided that you conspicuously **and** appropriately publish on each copy an appropriate copyright notice; keep intact **all** notices stating that this License **and any** non-permissive terms added **in** accord **with** section 7 apply to the code; keep intact **all** notices of the absence of **any** warranty; **and** give **all** recipients a copy of this License along **with** the Program.

(continues on next page)

(continued from previous page)

You may charge **any** price **or** no price **for** each copy that you convey, **and** you may offer support **or** warranty protection **for** a fee.

#### 5. Conveying Modified Source Versions.

You may convey a work based on the Program, **or** the modifications to produce it **from the** Program, **in** the form of source code under the terms of section 4, provided that you also meet **all** of these conditions:

- a) The work must carry prominent notices stating that you modified it, **and** giving a relevant date.
- b) The work must carry prominent notices stating that it **is** released under this License **and any** conditions added under section 7. This requirement modifies the requirement **in** section 4 to "**keep intact all notices**".
- c) You must license the entire work, **as** a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along **with any** applicable section 7 additional terms, to the whole of the work, **and all** its parts, regardless of how they are packaged. This License gives no permission to license the work **in any** other way, but it does **not** invalidate such permission **if** you have separately received it.
- d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, **if** the Program has interactive interfaces that do **not** display Appropriate Legal Notices, your work need **not** make them do so.

A compilation of a covered work **with** other separate **and** independent works, which are **not** by their nature extensions of the covered work, **and** which are **not** combined **with** it such **as** to form a larger program, **in or** on a volume of a storage **or** distribution medium, **is** called an "**aggregate**" **if** the compilation **and** its resulting copyright are **not** used to limit the access **or** legal rights of the compilation's **users** beyond what the individual works permit. Inclusion of a covered work **in** an aggregate does **not** cause this License to apply to the other parts of the aggregate.

#### 6. Conveying Non-Source Forms.

You may convey a covered work **in object** code form under the terms of sections 4 **and** 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, **in** one of these ways:

- a) Convey the **object** code **in, or** embodied **in**, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used **for** software interchange.

(continues on next page)

(continued from previous page)

b) Convey the **object** code **in, or** embodied **in**, a physical product (including a physical distribution medium), accompanied by a written offer, valid **for** at least three years **and** valid **for as long as** you offer spare parts **or** customer support **for** that product model, to give anyone who possesses the **object** code either (1) a copy of the Corresponding Source **for all** the software **in** the product that **is** covered by this License, on a durable physical medium customarily used **for** software interchange, **for** a price no more than your reasonable cost of physically performing this conveying of source, **or** (2) access to copy the Corresponding Source **from a** network server at no charge.

c) Convey individual copies of the **object** code **with** a copy of the written offer to provide the Corresponding Source. This alternative **is** allowed only occasionally **and** noncommercially, **and** only **if** you received the **object** code **with** such an offer, **in** accord **with** subsection 6b.

d) Convey the **object** code by offering access **from a** designated place (gratis **or for** a charge), **and** offer equivalent access to the Corresponding Source **in** the same way through the same place at no further charge. You need **not** require recipients to copy the Corresponding Source along **with** the **object** code. If the place to copy the **object** code **is** a network server, the Corresponding Source may be on a different server (operated by you **or** a third party) that supports equivalent copying facilities, provided you maintain clear directions **next** to the **object** code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it **is** available **for as long as** needed to satisfy these requirements.

e) Convey the **object** code using peer-to-peer transmission, provided you inform other peers where the **object** code **and** Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the **object** code, whose source code **is** excluded **from the** Corresponding Source **as** a System Library, need **not** be included **in** conveying the **object** code work.

A "User Product" **is** either (1) a "consumer product", which means **any** tangible personal **property** which **is** normally used **for** personal, family, **or** household purposes, **or** (2) anything designed **or** sold **for** incorporation into a dwelling. In determining whether a product **is** a consumer product, doubtful cases shall be resolved **in** favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical **or** common use of that **class of** product, regardless of the status of the particular user **or** of the way **in** which the particular user actually uses, **or** expects **or is** expected to use, the product. A product **is** a consumer product regardless of whether the product has substantial commercial, industrial **or** non-consumer uses, unless such uses represent

(continues on next page)

(continued from previous page)

the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

## 7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

(continues on next page)

(continued from previous page)

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

- a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or
- b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
- c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or
- d) Limiting the use for publicity purposes of names of licensors or authors of the material; or
- e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or
- f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

## 8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under

(continues on next page)

(continued from previous page)

this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

#### 9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

#### 10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the

(continues on next page)

(continued from previous page)

rights granted **or** affirmed under this License. For example, you may **not** impose a license fee, royalty, **or** other charge **for** exercise of rights granted under this License, **and** you may **not** initiate litigation (including a cross-claim **or** counterclaim **in** a lawsuit) alleging that **any** patent claim **is** infringed by making, using, selling, offering **for** sale, **or** importing the Program **or** **any** portion of it.

## 11. Patents.

A "**contributor**" **is** a copyright holder who authorizes use under this License of the Program **or** a work on which the Program **is** based. The work thus licensed **is** called the contributor's "**contributor version**".

A contributor's "**essential patent claims**" are all patent claims owned **or** controlled by the contributor, whether already acquired **or** hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, **or** selling its contributor version, but do **not** include claims that would be infringed only **as** a consequence of further modification of the contributor version. For purposes of this definition, "**control**" includes the right to grant patent sublicenses **in** a manner consistent **with** the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's **essential patent claims**, to make, use, sell, offer **for** sale, **import and** otherwise run, modify **and** propagate the contents of its contributor version.

In the following three paragraphs, a "**patent license**" **is** any express agreement **or** commitment, however denominated, **not** to enforce a patent (such **as** an express permission to practice a patent **or** covenant **not** to sue **for** patent infringement). To "**grant**" such a patent license to a party means to make such an agreement **or** commitment **not** to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, **and** the Corresponding Source of the work **is not** available **for** anyone to copy, free of charge **and** under the terms of this License, through a publicly available network server **or** other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, **or** (2) arrange to deprive yourself of the benefit of the patent license **for** this particular work, **or** (3) arrange, **in** a manner consistent **with** the requirements of this License, to extend the patent license to downstream recipients. "**Knowingly relying**" means you have actual knowledge that, but **for** the patent license, your conveying the covered work **in** a country, **or** your recipient's **use of the covered work in** a country, would infringe one **or** more identifiable patents **in** that country that you have reason to believe are valid.

If, pursuant to **or in** connection **with** a single transaction **or** arrangement, you convey, **or** propagate by procuring conveyance of, a covered work, **and** grant a patent license to some of the parties

(continues on next page)

(continued from previous page)

receiving the covered work authorizing them to use, propagate, modify **or** convey a specific copy of the covered work, then the patent license you grant **is** automatically extended to **all** recipients of the covered work **and** works based on it.

A patent license **is** "discriminatory" **if** it does **not** include within the scope of its coverage, prohibits the exercise of, **or is** conditioned on the non-exercise of one **or** more of the rights that are specifically granted under this License. You may **not** convey a covered work **if** you are a party to an arrangement **with** a third party that **is in** the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, **and** under which the third party grants, to **any** of the parties who would receive the covered work **from you**, a discriminatory patent license (a) **in** connection **with** copies of the covered work conveyed by you (**or** copies made **from those** copies), **or** (b) primarily **for and in** connection **with** specific products **or** compilations that contain the covered work, unless you entered into that arrangement, **or** that patent license was granted, prior to 28 March 2007.

Nothing **in** this License shall be construed **as** excluding **or** limiting **any** implied license **or** other defenses to infringement that may otherwise be available to you under applicable patent law.

#### 12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement **or** otherwise) that contradict the conditions of this License, they do **not** excuse you **from the** conditions of this License. If you cannot convey a covered work so **as** to satisfy simultaneously your obligations under this License **and any** other pertinent obligations, then **as** a consequence you may **not** convey it at **all**. For example, **if** you agree to terms that obligate you to collect a royalty **for** further conveying **from those** to whom you convey the Program, the only way you could satisfy both those terms **and** this License would be to refrain entirely **from conveying** the Program.

#### 13. Use **with** the GNU Affero General Public License.

Notwithstanding **any** other provision of this License, you have permission to link **or** combine **any** covered work **with** a work licensed under version 3 of the GNU Affero General Public License into a single combined work, **and** to convey the resulting work. The terms of this License will **continue** to apply to the part which **is** the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination **as** such.

#### 14. Revised Versions of this License.

The Free Software Foundation may publish revised **and/or** new versions of the GNU General Public License **from time** to time. Such new versions will be similar **in** spirit to the present version, but may differ **in** detail to

(continues on next page)

(continued from previous page)

address new problems **or** concerns.

Each version **is** given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "**or any later version**" applies to it, you have the option of following the terms **and** conditions either of that numbered version **or** of **any** later version published by the Free Software Foundation. If the Program does **not** specify a version number of the GNU General Public License, you may choose **any** version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version **for** the Program.

Later license versions may give you additional **or** different permissions. However, no additional obligations are imposed on **any** author **or** copyright holder **as** a result of your choosing to follow a later version.

#### 15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "**AS IS**" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

#### 16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

#### 17. Interpretation of Sections 15 **and** 16.

If the disclaimer of warranty **and** limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of **all** civil liability **in** connection **with** the Program, unless a warranty **or** assumption of liability accompanies a copy of the Program **in return for** a fee.

## END OF TERMS AND CONDITIONS

## 13.3 libloot Documentation

GNU Free Documentation License  
Version 1.3, 3 November 2008

Copyright (C) 2000, 2001, 2002, 2007, 2008 Free Software Foundation, Inc.  
<<http://fsf.org/>>

Everyone **is** permitted to copy **and** distribute verbatim copies  
of this license document, but changing it **is not** allowed.

### 0. PREAMBLE

The purpose of this License **is** to make a manual, textbook, **or** other  
functional **and** useful document "**free**" **in** the sense of freedom: to  
assure everyone the effective freedom to copy **and** redistribute it,  
**with or** without modifying it, either commercially **or** noncommercially.  
Secondarily, this License preserves **for** the author **and** publisher a way  
to get credit **for** their work, **while not** being considered responsible  
**for** modifications made by others.

This License **is** a kind of "**copyleft**", which means that derivative  
works of the document must themselves be free **in** the same sense. It  
complements the GNU General Public License, which **is** a copyleft  
license designed **for** free software.

We have designed this License **in** order to use it **for** manuals **for** free  
software, because free software needs free documentation: a free  
program should come **with** manuals providing the same freedoms that the  
software does. But this License **is not** limited to software manuals;  
it can be used **for any** textual work, regardless of subject matter **or**  
whether it **is** published **as** a printed book. We recommend this License  
principally **for** works whose purpose **is** instruction **or** reference.

### 1. APPLICABILITY AND DEFINITIONS

This License applies to **any** manual **or** other work, **in any** medium, that  
contains a notice placed by the copyright holder saying it can be  
distributed under the terms of this License. Such a notice grants a  
world-wide, royalty-free license, unlimited **in** duration, to use that  
work under the conditions stated herein. The "**Document**", below,  
refers to **any** such manual **or** work. Any member of the public **is** a  
licensee, **and is** addressed **as** "**you**". You accept the license **if** you

(continues on next page)

(continued from previous page)

copy, modify **or** distribute the work **in** a way requiring permission under copyright law.

A "Modified Version" of the Document means **any** work containing the Document **or** a portion of it, either copied verbatim, **or with** modifications **and/or** translated into another language.

A "Secondary Section" **is** a named appendix **or** a front-matter section of the Document that deals exclusively **with** the relationship of the publishers **or** authors of the Document to the Document's **overall** subject (**or** to related matters) **and** contains nothing that could fall directly within that overall subject. (Thus, **if** the Document **is in** part a textbook of mathematics, a Secondary Section may **not** explain **any** mathematics.) The relationship could be a matter of historical connection **with** the subject **or with** related matters, **or** of legal, commercial, philosophical, ethical **or** political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, **as** being those of Invariant Sections, **in** the notice that says that the Document **is** released under this License. If a section does **not** fit the above definition of Secondary then it **is not** allowed to be designated **as** Invariant. The Document may contain zero Invariant Sections. If the Document does **not** identify **any** Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, **as** Front-Cover Texts **or** Back-Cover Texts, **in** the notice that says that the Document **is** released under this License. A Front-Cover Text may be at most **5** words, **and** a Back-Cover Text may be at most **25** words.

A "Transparent" copy of the Document means a machine-readable copy, represented **in** a **format** whose specification **is** available to the general public, that **is** suitable **for** revising the document straightforwardly **with** generic text editors **or** (**for** images composed of pixels) generic paint programs **or** (**for** drawings) some widely available drawing editor, **and** that **is** suitable **for input** to text formatters **or for** automatic translation to a variety of formats suitable **for input** to text formatters. A copy made **in** an otherwise Transparent file **format** whose markup, **or** absence of markup, has been arranged to thwart **or** discourage subsequent modification by readers **is not** Transparent. An image **format is not** Transparent **if** used **for any** substantial amount of text. A copy that **is not** "Transparent" **is** called "Opaque".

Examples of suitable formats **for** Transparent copies include plain ASCII without markup, Texinfo **input format**, LaTeX **input format**, SGML **or** XML using a publicly available DTD, **and** standard-conforming simple HTML, PostScript **or** PDF designed **for** human modification. Examples of transparent image formats include PNG, XCF **and** JPG. Opaque formats include proprietary formats that can be read **and** edited only by proprietary word processors, SGML **or** XML **for** which the DTD **and/or** processing tools are **not** generally available, **and** the

(continues on next page)

(continued from previous page)

machine-generated HTML, PostScript **or** PDF produced by some word processors **for** output purposes only.

The "Title Page" means, **for** a printed book, the title page itself, plus such following pages **as** are needed to hold, legibly, the material this License requires to appear **in** the title page. For works **in** formats which do **not** have **any** title page **as** such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

The "publisher" means **any** person **or** entity that distributes copies of the Document to the public.

A section "Entitled XYZ" means a named subunit of the Document whose title either **is** precisely XYZ **or** contains XYZ **in** parentheses following text that translates XYZ **in** another language. (Here XYZ stands **for** a specific section name mentioned below, such **as** "Acknowledgements", "Dedications", "Endorsements", **or** "History".) To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers **next** to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference **in** this License, but only **as** regards disclaiming warranties: **any** other implication that these Warranty Disclaimers may have **is** void **and** has no effect on the meaning of this License.

## 2. VERBATIM COPYING

You may copy **and** distribute the Document **in any** medium, either commercially **or** noncommercially, provided that this License, the copyright notices, **and** the license notice saying this License applies to the Document are reproduced **in all** copies, **and** that you add no other conditions whatsoever to those of this License. You may **not** use technical measures to obstruct **or** control the reading **or** further copying of the copies you make **or** distribute. However, you may accept compensation **in** exchange **for** copies. If you distribute a large enough number of copies you must also follow the conditions **in** section 3.

You may also lend copies, under the same conditions stated above, **and** you may publicly display copies.

## 3. COPYING IN QUANTITY

If you publish printed copies (**or** copies **in** media that commonly have printed covers) of the Document, numbering more than 100, **and** the Document's license notice requires Cover Texts, you must enclose the copies **in** covers that carry, clearly **and** legibly, **all** these Cover Texts: Front-Cover Texts on the front cover, **and** Back-Cover Texts on the back cover. Both covers must also clearly **and** legibly identify

(continues on next page)

(continued from previous page)

you **as** the publisher of these copies. The front cover must present the full title **with all** words of the title equally prominent **and** visible. You may add other material on the covers **in** addition. Copying **with** changes limited to the covers, **as long as** they preserve the title of the Document **and** satisfy these conditions, can be treated **as** verbatim copying **in** other respects.

If the required texts **for** either cover are too voluminous to fit legibly, you should put the first ones listed (**as many as** fit reasonably) on the actual cover, **and continue** the rest onto adjacent pages.

If you publish **or** distribute Opaque copies of the Document numbering more than **100**, you must either include a machine-readable Transparent copy along **with** each Opaque copy, **or** state **in or with** each Opaque copy a computer-network location **from which** the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies **in** quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly **or** through your agents **or** retailers) of that edition to the public.

It **is** requested, but **not** required, that you contact the authors of the Document well before redistributing **any** large number of copies, to give them a chance to provide you **with** an updated version of the Document.

#### 4. MODIFICATIONS

You may copy **and** distribute a Modified Version of the Document under the conditions of sections **2 and 3** above, provided that you release the Modified Version under precisely this License, **with** the Modified Version filling the role of the Document, thus licensing distribution **and** modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things **in** the Modified Version:

- A. Use **in** the Title Page (**and** on the covers, **if any**) a title distinct **from that** of the Document, **and from those** of previous versions (which should, **if** there were **any**, be listed **in** the History section of the Document). You may use the same title **as** a previous version **if** the original publisher of that version gives permission.
- B. List on the Title Page, **as** authors, one **or** more persons **or** entities responsible **for** authorship of the modifications **in** the Modified Version, together **with** at least five of the principal authors of the Document (**all** of its principal authors, **if** it has fewer than five), unless they release you **from this** requirement.
- C. State on the Title page the name of the publisher of the Modified Version, **as** the publisher.

(continues on next page)

(continued from previous page)

- D. Preserve **all** the copyright notices of the Document.
- E. Add an appropriate copyright notice **for** your modifications adjacent to the other copyright notices.
- F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, **in** the form shown **in** the Addendum below.
- G. Preserve **in** that license notice the full lists of Invariant Sections **and** required Cover Texts given **in** the Document's **license notice**.
- H. Include an unaltered copy of this License.
- I. Preserve the section Entitled "**History**", Preserve its Title, **and** add to it an item stating at least the title, year, new authors, **and** publisher of the Modified Version **as** given on the Title Page. If there **is** no section Entitled "**History**" **in** the Document, create one stating the title, year, authors, **and** publisher of the Document **as** given on its Title Page, then add an item describing the Modified Version **as** stated **in** the previous sentence.
- J. Preserve the network location, **if any**, given **in** the Document **for** public access to a Transparent copy of the Document, **and** likewise the network locations given **in** the Document **for** previous versions it was based on. These may be placed **in** the "**History**" section. You may omit a network location **for** a work that was published at least four years before the Document itself, **or if** the original publisher of the version it refers to gives permission.
- K. For **any** section Entitled "**Acknowledgements**" **or** "**Dedications**", Preserve the Title of the section, **and** preserve **in** the section **all** the substance **and** tone of each of the contributor acknowledgements **and/or** dedications given therein.
- L. Preserve **all** the Invariant Sections of the Document, unaltered **in** their text **and in** their titles. Section numbers **or** the equivalent are **not** considered part of the section titles.
- M. Delete **any** section Entitled "**Endorsements**". Such a section may **not** be included **in** the Modified Version.
- N. Do **not** retitle **any** existing section to be Entitled "**Endorsements**" **or** to conflict **in** title **with any** Invariant Section.
- O. Preserve **any** Warranty Disclaimers.

If the Modified Version includes new front-matter sections **or** appendices that qualify **as** Secondary Sections **and** contain no material copied **from the** Document, you may at your option designate some **or all** of these sections **as** invariant. To do this, add their titles to the **list** of Invariant Sections **in** the Modified Version's **license notice**. These titles must be distinct **from any** other section titles.

You may add a section Entitled "**Endorsements**", provided it contains nothing but endorsements of your Modified Version by various parties--**for** example, statements of peer review **or** that the text has been approved by an organization **as** the authoritative definition of a standard.

You may add a passage of up to five words **as** a Front-Cover Text, **and** a passage of up to 25 words **as** a Back-Cover Text, to the end of the **list** of Cover Texts **in** the Modified Version. Only one passage of

(continues on next page)

(continued from previous page)

Front-Cover Text **and** one of Back-Cover Text may be added by (**or** through arrangements made by) **any** one entity. If the Document already includes a cover text **for** the same cover, previously added by you **or** by arrangement made by the same entity you are acting on behalf of, you may **not** add another; but you may replace the old one, on explicit permission **from the** previous publisher that added the old one.

The author(s) **and** publisher(s) of the Document do **not** by this License give permission to use their names **for** publicity **for or** to **assert or** imply endorsement of **any** Modified Version.

## 5. COMBINING DOCUMENTS

You may combine the Document **with** other documents released under this License, under the terms defined **in** section 4 above **for** modified versions, provided that you include **in** the combination **all** of the Invariant Sections of **all** of the original documents, unmodified, **and** **list** them **all as** Invariant Sections of your combined work **in** its license notice, **and** that you preserve **all** their Warranty Disclaimers.

The combined work need only contain one copy of this License, **and** multiple identical Invariant Sections may be replaced **with** a single copy. If there are multiple Invariant Sections **with** the same name but different contents, make the title of each such section unique by adding at the end of it, **in** parentheses, the name of the original author **or** publisher of that section **if** known, **or else** a unique number. Make the same adjustment to the section titles **in** the **list** of Invariant Sections **in** the license notice of the combined work.

In the combination, you must combine **any** sections Entitled "**History**" **in** the various original documents, forming one section Entitled "**History**"; likewise combine **any** sections Entitled "**Acknowledgements**", **and any** sections Entitled "**Dedications**". You must delete **all** sections Entitled "**Endorsements**".

## 6. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document **and** other documents released under this License, **and** replace the individual copies of this License **in** the various documents **with** a single copy that **is** included **in** the collection, provided that you follow the rules of this License **for** verbatim copying of each of the documents **in all** other respects.

You may extract a single document **from such** a collection, **and** distribute it individually under this License, provided you insert a copy of this License into the extracted document, **and** follow this License **in all** other respects regarding verbatim copying of that document.

(continues on next page)

## 7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document **or** its derivatives **with** other separate **and** independent documents **or** works, **in or** on a volume of a storage **or** distribution medium, **is** called an "aggregate" **if** the copyright resulting **from the** compilation **is not** used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document **is** included **in** an aggregate, this License does **not** apply to the other works **in** the aggregate which are **not** themselves derivative works of the Document.

If the Cover Text requirement of section 3 **is** applicable to these copies of the Document, then **if** the Document **is** less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, **or** the electronic equivalent of covers **if** the Document **is in** electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

## 8. TRANSLATION

Translation **is** considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections **with** translations requires special permission **from their** copyright holders, but you may include translations of some **or all** Invariant Sections **in** addition to the original versions of these Invariant Sections. You may include a translation of this License, **and all** the license notices **in** the Document, **and any** Warranty Disclaimers, provided that you also include the original English version of this License **and** the original versions of those notices **and** disclaimers. In case of a disagreement between the translation **and** the original version of this License **or** a notice **or** disclaimer, the original version will prevail.

If a section **in** the Document **is** Entitled "Acknowledgements", "Dedications", **or** "History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

## 9. TERMINATION

You may **not** copy, modify, sublicense, **or** distribute the Document **except as** expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, **or** distribute it **is** void, **and** will automatically terminate your rights under this License.

However, **if** you cease **all** violation of this License, then your license **from a** particular copyright holder **is** reinstated (a) provisionally, unless **and** until the copyright holder explicitly **and finally**

(continued from previous page)

terminates your license, **and** (b) permanently, **if** the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license **from a** particular copyright holder **is** reinstated permanently **if** the copyright holder notifies you of the violation by some reasonable means, this **is** the first time you have received notice of violation of this License (**for any work**) **from that** copyright holder, **and** you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does **not** terminate the licenses of parties who have received copies **or** rights **from you** under this License. If your rights have been terminated **and not** permanently reinstated, receipt of a copy of some **or all** of the same material does **not** give you **any** rights to use it.

## 10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License **from time** to time. Such new versions will be similar **in** spirit to the present version, but may differ **in** detail to address new problems **or** concerns. See <http://www.gnu.org/copyleft/>.

Each version of the License **is** given a distinguishing version number. If the Document specifies that a particular numbered version of this License "**or any later version**" applies to it, you have the option of following the terms **and** conditions either of that specified version **or** of **any** later version that has been published (**not as** a draft) by the Free Software Foundation. If the Document does **not** specify a version number of this License, you may choose **any** version ever published (**not as** a draft) by the Free Software Foundation. If the Document specifies that a proxy can decide which future versions of this License can be used, that proxy's **public statement of acceptance of a** version permanently authorizes you to choose that version **for** the Document.

## 11. RELICENSING

"Massive Multiauthor Collaboration Site" (**or "MMC Site"**) means **any** World Wide Web server that publishes copyrightable works **and** also provides prominent facilities **for** anybody to edit those works. A public wiki that anybody can edit **is** an example of such a server. A "Massive Multiauthor Collaboration" (**or "MMC"**) contained **in** the site means **any set** of copyrightable works thus published on the MMC site.

"CC-BY-SA" means the Creative Commons Attribution-Share Alike 3.0 license published by Creative Commons Corporation, a **not-for-profit** corporation **with** a principal place of business **in** San Francisco, California, **as well as** future copyleft versions of that license

(continues on next page)

(continued from previous page)

published by that same organization.

"Incorporate" means to publish **or** republish a Document, **in** whole **or in** part, **as** part of another Document.

An MMC **is** "eligible for relicensing" **if** it **is** licensed under this License, **and if all** works that were first published under this License somewhere other than this MMC, **and** subsequently incorporated **in** whole **or in** part into the MMC, (1) had no cover texts **or** invariant sections, **and** (2) were thus incorporated prior to November 1, 2008.

The operator of an MMC Site may republish an MMC contained **in** the site under CC-BY-SA on the same site at **any** time before August 1, 2009, provided the MMC **is** eligible **for** relicensing.
